PCN0902

ADDITIONAL ASSEMBLY SOURCE AND BILL OF MATERIAL CHANGE FOR ALTERA FLIP CHIP PRODUCTS

Change Description

This is an update to PCN0902; please see the revision history table for information specific to this update.

The purpose of this notification is to announce the qualification of Amkor Technology Taiwan (AHT), located in Hukou, Taiwan as an additional assembly manufacturing site for Altera® flip-chip packages. AHT will become the primary assembly site for the products indicated in this change notification. Altera has also qualified alternate construction materials, including the conversion from high lead (Pb) to eutectic bump composition and from a two-piece lid to a single-piece lid (SPL). These construction materials will be standardized across both Amkor Korea (ATK) and AHT.

This change does not affect the fit or function of the devices. There is a slight appearance change to the form due to the conversion from a two-piece to a single-piece lid. There is no change in the current moisture sensitivity rating levels (per JEDEC J-STD-020D) or the thermal performance. The package dimensions are the same. Both the single-piece and the two-piece lids are constructed using the same Ni plated Cu materials.

Recommended Action

Customers may want to review their existing heatsink application for compatibility with the new SPL design. Both the additional assembly site and the construction material set change have been verified through the successful completion of full qualification. Supporting reliability data are included in this notification.

Reason for Change

The alternate construction material set allows Altera's larger packages to withstand 260° C reflow temperatures required by JEDEC to support Pb-free manufacturing. This change also enables Altera to better support long-term customer demand for the affected products. Altera will continue to have the flexibility to ship products from both Amkor Korea and Amkor Technology Taiwan.

Products Affected

The product lines affected by this change are listed in Table 1. A list of ordering part numbers is included in Appendix I. There are exception product lines that will incorporate the bump change but not the lid change, see Table 3. A list of the exception ordering part numbers is included in Appendix II. The products will transition to the new changes as the current inventory is consumed. Target transition dates are subject to change based on product demand.

Bump Composition	High Pb (5%Sn/95%Pb)	Eutectic (63%Sn/37%Pb)
Expected Implementation		TBD

Product Traceability and Transition Dates

This change will be implemented in July 2009. Customers may receive products with this change beginning with a date-code marking of 0925 or later on the top of the package. See Figure 1. The 0925 date-code marking indicates the earliest date that the new material may be used for any of the affected devices. However, initial samples may have an earlier date-code marking.
