

Features

- **HIGH-DENSITY PROGRAMMABLE LOGIC**
 - High-Speed Global Interconnect
 - 4000 PLD Gates
 - 48 I/O Pins, Six Dedicated Inputs
 - 144 Registers
 - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
 - Small Logic Block Size for Fast Random Logic
 - Security Cell Prevents Unauthorized Copying
- **HIGH PERFORMANCE E²CMOS[®] TECHNOLOGY**
 - $f_{max} = 60$ MHz Maximum Operating Frequency
 - $t_{pd} = 20$ ns Propagation Delay
 - TTL Compatible Inputs and Outputs
 - Electrically Erasable and Reprogrammable
 - Non-Volatile E²CMOS Technology
 - 100% Tested
- **IN-SYSTEM PROGRAMMABLE**
 - In-System Programmable[™] (ISP[™]) 5-Volt Only
 - Increased Manufacturing Yields, Reduced Time-to-Market, and Improved Product Quality
 - Reprogram Soldered Devices for Faster Debugging
- **COMBINES EASE OF USE AND THE FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS**
 - Complete Programmable Device Can Combine Glue Logic and Structured Designs
 - Four Dedicated Clock Input Pins
 - Synchronous and Asynchronous Clocks
 - Flexible Pin Placement
 - Optimized Global Routing Pool Provides Global Interconnectivity

Functional Block Diagram

Description

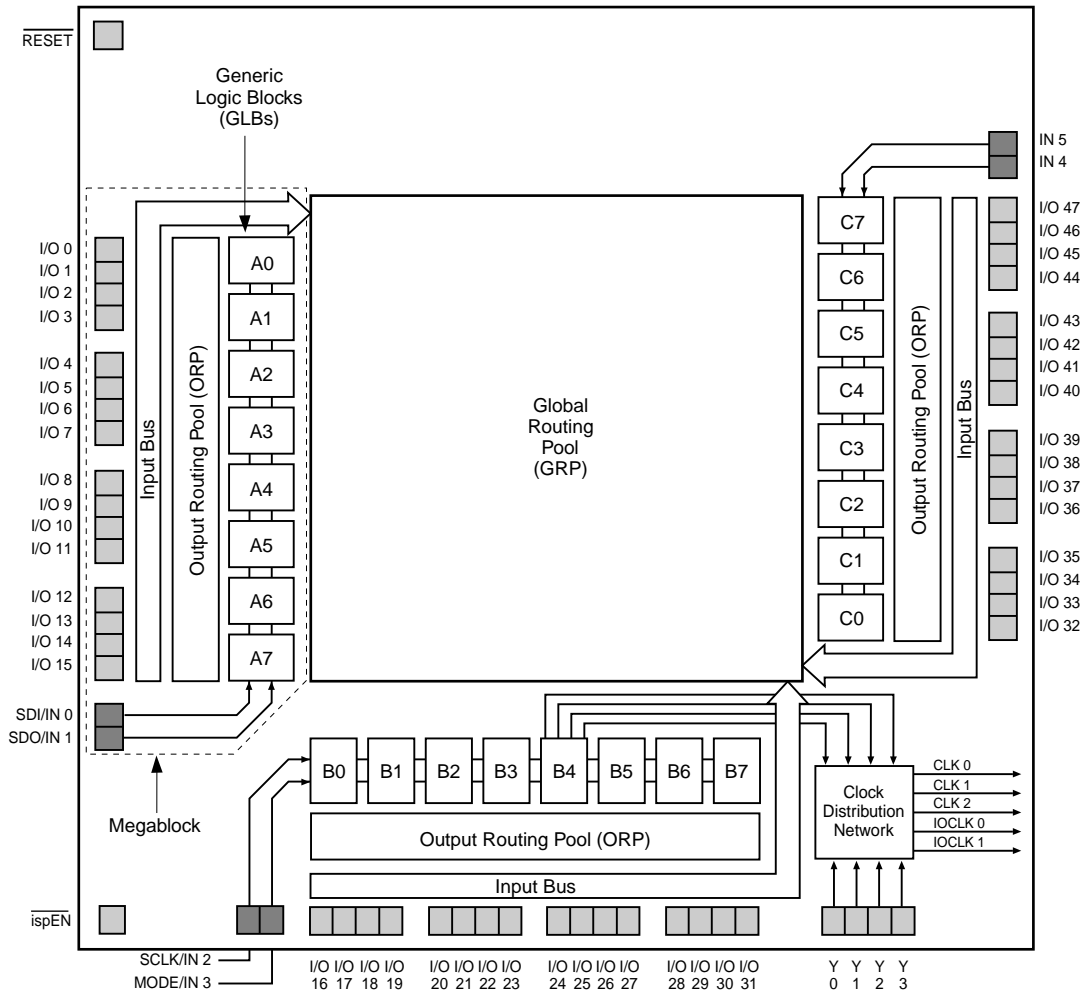

The ispLSI 1024/883 is a High-Density Programmable Logic Device processed in full compliance to MIL-STD-883. This military grade device contains 144 Registers, 48 Universal I/O pins, six Dedicated Input pins, four Dedicated Clock Input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 1024/883 features 5-Volt in-system programmability and in-system diagnostic capabilities. It is the first device which offers non-volatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems.

The basic unit of logic on the ispLSI 1024/883 device is the Generic Logic Block (GLB). The GLBs are labeled A0, A1 .. C7 (see figure 1). There are a total of 24 GLBs in the ispLSI 1024/883 device. Each GLB has 18 inputs, a programmable AND/OR/XOR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any other GLB on the device.

Functional Block Diagram

Figure 1. ispLSI 1024/883 Functional Block Diagram

0139D_1024.eps

The device also has 48 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, registered input, latched input, output or bi-directional I/O pin with 3-state control. Additionally, all outputs are polarity selectable, active high or active low. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA.

Eight GLBs, 16 I/O cells, two dedicated inputs and one ORP are connected together to make a Megablock (see figure 1). The outputs of the eight GLBs are connected to a set of 16 universal I/O cells by the ORP. The I/O cells within the Megablock also share a common Output Enable (OE) signal. The ispLSI 1024/883 device contains three of these Megablocks.

The GRP has as its inputs the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI 1024/883 device are selected using the Clock Distribution Network. Four dedicated clock pins (Y0, Y1, Y2 and Y3) are brought into the distribution network, and five clock outputs (CLK 0, CLK 1, CLK 2, IOCLK 0 and IOCLK 1) are provided to route clocks to the GLBs and I/O cells. The Clock Distribution Network can also be driven from a special clock GLB (B4 on the ispLSI 1024/883 device). The logic of this GLB allows the user to create an internal clock from a combination of internal signals within the device.

Absolute Maximum Ratings ¹

Supply Voltage V_{CC} -0.5 to +7.0V
 Input Voltage Applied -2.5 to $V_{CC} + 1.0V$
 Off-State Output Voltage Applied -2.5 to $V_{CC} + 1.0V$
 Storage Temperature -65 to 150°C
 Case Temp. with Power Applied -55 to 125°C
 Max. Junction Temp. (T_J) with Power Applied ... 150°C

1. Stresses above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

DC Recommended Operating Conditions

SYMBOL	PARAMETER	MIN.	MAX.	UNITS	
V_{CC}	Supply Voltage	Military/883 $T_C = -55^{\circ}\text{C}$ to $+125^{\circ}\text{C}$	4.5	5.5	
V_{IL}	Input Low Voltage	0	0.8	V	
V_{IH}	Input High Voltage	2.0	$V_{CC} + 1$	V	

0005A mil.eps

Capacitance ($T_A=25^{\circ}\text{C}$, $f=1.0\text{ MHz}$)

SYMBOL	PARAMETER	MAXIMUM ¹	UNITS	TEST CONDITIONS

DC Electrical Characteristics

Over Recommended Operating Conditions

SYMBOL	PARAMETER	CONDITION	MIN.	TYP. ³	MAX.	UNITS
V_{OL}	Output Low Voltage	$I_{OL} = 8 \text{ mA}$	–	–	0.4	V
V_{OH}	Output High Voltage	$I_{OH} = -4 \text{ mA}$	2.4	–	–	V
I_{IL}	Input or I/O Low Leakage Current	$0V \leq V_{IN} \leq V_{IL} \text{ (MAX.)}$	–	–	-10	μA
I_{IH}	Input or I/O High Leakage Current	$3.5V \leq V_{IN} \leq V_{CC}$	–	–	10	μA
I_{IL-isp}	isp Input Low Leakage Current	$0V \leq V_{IN} \leq V_{IL} \text{ (MAX.)}$	–	–	-150	μA
I_{IL-PU}	I/O Active Pull-Up Current	$0V \leq V_{IN} \leq V_{IL}$	–	–	-150	μA
I_{OS1}	Output Short Circuit Current	$V_{CC} = 5V, V_{OUT} = 0.5V$	–	–	-200	mA
I_{CC2,4}	Operating Power Supply Current	$V_{IL} = 0.5V, V_{IH} = 3.0V$ $f_{TOGGLE} = 1 \text{ MHz}$	–	135	215	mA

1. One output at a time for a maximum duration of one second. $V_{out} = 0.5V$ was selected to avoid test problems by tester ground degradation. Characterized but not 100% tested.
2. Measured using six 16-bit counters.
3. Typical values are at $V_{CC} = 5V$ and $T_A = 25^\circ C$.
4. Maximum I_{CC} varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this datasheet and Thermal Management section of the Lattice Semiconductor Data Book or CD-ROM to estimate maximum I_{CC} .

 \end{aligned}$$

1. Calculations are based upon timing specifications for the ispLSI 1024-60.

Maximum GRP Delay vs GLB Loads

0126A-80-24-mil.eps

Power Consumption

Power consumption in the ispLSI 1024/883 device depends on two primary factors: the speed at which the device is operating, and the number of Product Terms

used. Figure 3 shows the relationship between power and operating speed.

Figure 3. Typical Device Power Consumption vs fmax

Notes: Configuration of Six 16-bit Counters
Typical Current at 5V, 25°C

ICC can be estimated for the ispLSI 1024 using the following equation:

$$I_{CC} = 42 + (\# \text{ of PTs} * 0.45) + (\# \text{ of nets} * \text{Max. freq} * 0.008) \text{ where:}$$

of PTs = Number of Product Terms used in design

of nets = Number of Signals used in device

Max. freq = Highest Clock Frequency to the device

The ICC estimate is based on typical conditions (VCC = 5.0V, room temperature) and an assumption of 2 GLB loads on average exists. These values are for estimates only. Since the value of ICC is sensitive to operating conditions and the program in the device, the actual ICC should be verified.

Pin Description

NAME	JLCC PIN NUMBERS	DESCRIPTION
I/O 0 - I/O 3 I/O 4 - I/O 7 I/O 8 - I/O 11 I/O 12 - I/O 15 I/O 16 - I/O 19 I/O 20 - I/O 23 I/O 24 - I/O 27 I/O 28 - I/O 31 I/O 32 - I/O 35 I/O 36 - I/O 39 I/O 40 - I/O 43 I/O 44 - I/O 47	22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14	Input/Output Pins - These are the general purpose I/O pins used by the logic array.
IN 4 - IN 5	2, 15	Input - These pins are dedicated input pins to the device.
$\overline{\text{ispEN}}$	19	Input - Dedicated in-system programming enable input pin. This pin is brought low to enable the programming mode. The MODE, SDI, SDO and SCLK options become active.
SDI/IN 0 ¹	21	Input - This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as an input pin to load programming data into the device. SDI/IN 0 is also used as one of the two control pins for the isp state machine. It is a dedicated input pin when $\overline{\text{ispEN}}$ is logic high.
MODE/IN 3 ¹	55	Input - This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as pin to control the operation of the isp state machine. It is a dedicated input pin when $\overline{\text{ispEN}}$ is logic high.
SDO/IN 1 ¹	34	Output/Input - This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as an output pin to read serial shift register data. It is a dedicated input pin when $\overline{\text{ispEN}}$ is logic high.
SCLK/IN 2 ¹	49	Input - This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as a clock pin for the Serial Shift Register. It is a dedicated input pin when $\overline{\text{ispEN}}$ is logic high.
NC ²	—	No Connect
$\overline{\text{RESET}}$	20	Active Low (0) Reset pin which resets all of the GLB and I/O registers in the device.
Y0	16	Dedicated Clock input. This clock input is connected to one of the clock inputs of all of the GLBs on the device.
Y1	54	Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any GLB on the device.
Y2	51	Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any GLB and/or any I/O cell on the device.
Y3	50	Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any I/O cell on the device.
GND	1, 18, 35, 52	Ground (GND)
VCC	17, 36, 53, 68	V _{CC}
