

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

- **Highest-Performance Fixed-Point Digital Signal Processors (DSPs)**
 - 2-, 1.67-, 1.39-ns Instruction Cycle Time
 - 500-, 600-, 720-MHz Clock Rate
 - Eight 32-Bit Instructions/Cycle
 - Twenty-Eight Operations/Cycle
 - 4000, 4800, 5760 MIPS
 - Fully Software-Compatible With C62x™
 - C6414/15/16 Devices Pin-Compatible
- **VelociTI.2™ Extensions to VelociTI™ Advanced Very-Long-Instruction-Word (VLIW) TMS320C64x™ DSP Core**
 - Eight Highly Independent Functional Units With VelociTI.2™ Extensions:
 - Six ALUs (32-/40-Bit), Each Supports Single 32-Bit, Dual 16-Bit, or Quad 8-Bit Arithmetic per Clock Cycle
 - Two Multipliers Support Four 16 x 16-Bit Multiplies (32-Bit Results) per Clock Cycle or Eight 8 x 8-Bit Multiplies (16-Bit Results) per Clock Cycle
 - Non-Aligned Load-Store Architecture
 - 64 32-Bit General-Purpose Registers
 - Instruction Packing Reduces Code Size
 - All Instructions Conditional
- **Instruction Set Features**
 - Byte-Addressable (8-/16-/32-/64-Bit Data)
 - 8-Bit Overflow Protection
 - Bit-Field Extract, Set, Clear
 - Normalization, Saturation, Bit-Counting
 - VelociTI.2™ Increased Orthogonality
- **Viterbi Decoder Coprocessor (VCP) [C6416]**
 - Supports Over 600 7.95-Kbps AMR
 - Programmable Code Parameters
- **Turbo Decoder Coprocessor (TCP) [C6416]**
 - Supports up to 7 2-Mbps or 43 384-Kbps 3GPP (6 Iterations)
 - Programmable Turbo Code and Decoding Parameters
- **L1/L2 Memory Architecture**
 - 128K-Bit (16K-Byte) L1P Program Cache (Direct Mapped)
 - 128K-Bit (16K-Byte) L1D Data Cache (2-Way Set-Associative)
 - 8M-Bit (1024K-Byte) L2 Unified Mapped RAM/Cache (Flexible Allocation)
- **Two External Memory Interfaces (EMIFs)**
 - One 64-Bit (EMIFA), One 16-Bit (EMIFB)
 - Glueless Interface to Asynchronous Memories (SRAM and EPROM) and Synchronous Memories (SDRAM, SBSRAM, ZBT SRAM, and FIFO)
 - 1280M-Byte Total Addressable External Memory Space
- **Enhanced Direct-Memory-Access (EDMA) Controller (64 Independent Channels)**
- **Host-Port Interface (HPI)**
 - User-Configurable Bus Width (32-/16-Bit)
- **32-Bit/33-MHz, 3.3-V PCI Master/Slave Interface Conforms to PCI Specification 2.2 [C6415/C6416]**
 - Three PCI Bus Address Registers:
 - Prefetchable Memory
 - Non-Prefetchable Memory I/O
 - Four-Wire Serial EEPROM Interface
 - PCI Interrupt Request Under DSP Program Control
 - DSP Interrupt Via PCI I/O Cycle
- **Three Multichannel Buffered Serial Ports**
 - Direct I/F to T1/E1, MVIP, SCSA Framers
 - Up to 256 Channels Each
 - ST-Bus-Switching-, AC97-Compatible
 - Serial Peripheral Interface (SPI) Compatible (Motorola™)
- **Three 32-Bit General-Purpose Timers**
- **Universal Test and Operations PHY Interface for ATM (UTOPIA) [C6415/C6416]**
 - UTOPIA Level 2 Slave ATM Controller
 - 8-Bit Transmit and Receive Operations up to 50 MHz per Direction
 - User-Defined Cell Format up to 64 Bytes
- **Sixteen General-Purpose I/O (GPIO) Pins**
- **Flexible PLL Clock Generator**
- **IEEE-1149.1 (JTAG†) Boundary-Scan-Compatible**
- **532-Pin Ball Grid Array (BGA) Package (GLZ, ZLZ and CLZ Suffixes), 0.8-mm Ball Pitch**
- **0.13-μm/6-Level Cu Metal Process (CMOS)**
- **3.3-V I/Os, 1.2-V/1.25-V Internal (500 MHz)**
- **3.3-V I/Os, 1.4-V Internal (600 and 720 MHz)**

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

REVISION HISTORY

This data sheet revision history highlights the technical changes made to the SPRS146M device-specific data sheet to make it an SPRS146N revision.

Scope: Applicable updates to the C64x device family, specifically relating to the C6414, C6415, and C6416 devices, have been incorporated.

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

description

The TMS320C64x™ DSPs (including the TMS320C6414, TMS320C6415, and TMS320C6416 devices) are the highest-performance fixed-point DSP generation in the TMS320C6000™ DSP platform. The TMS320C64x™ (C64x™†) device is based on the second-generation high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture (VelociTI.2™) developed by Texas Instruments (TI), making these DSPs an excellent choice for multichannel and multifunction applications. The C64x™ is a code-compatible member of the C6000™ DSP platform.

With performance of up to 5760 million instructions per second (MIPS) at a clock rate of 720 MHz, the C64x devices offer cost-effective solutions to high-performance DSP programming challenges. The C64x DSPs possess the operational flexibility of high-speed controllers and the numerical capability of array processors. The C64x™ DSP core processor has 64 general-purpose registers of 32-bit word length and eight highly independent functional units—two multipliers for a 32-bit result and six arithmetic logic units (ALUs)—with VelociTI.2™ extensions. The VelociTI.2™ extensions in the eight functional units include new instructions to accelerate the performance in key applications and extend the parallelism of the VelociTI™ architecture. The C64x can produce four 16-bit multiply-accumulates (MACs) per cycle for a total of 2880 million MACs per second (MMACS), or eight 8-bit MACs per cycle for a total of 5760 MMACS. The C64x DSP also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals similar to the other C6000™ DSP platform devices.

The C6416 device has two high-performance embedded coprocessors [Viterbi Decoder Coprocessor (VCP) and Turbo Decoder Coprocessor (TCP)] that significantly speed up channel-decoding operations on-chip. The VCP operating at CPU clock divided-by-4 can decode over 600 7.95-Kbps adaptive multi-rate (AMR) [K = 9, R = 1/3] voice channels. The VCP supports constraint lengths K = 5, 6, 7, 8, and 9, rates R = 1/2, 1/3, and 1/4, and flexible polynomials, while generating hard decisions or soft decisions. The TCP operating at CPU clock divided-by-2 can decode up to forty-three 384-Kbps or seven 2-Mbps turbo encoded channels (assuming 6 iterations). The TCP implements the max*log-map algorithm and is designed to support all polynomials and rates required by Third-Generation Partnership Projects (3GPP and 3GPP2), with fully programmable frame length and turbo interleaver. Decoding parameters such as the number of iterations and stopping criteria are also programmable. Communications between the VCP/TCP and the CPU are carried out through the EDMA controller.

The C64x uses a two-level cache-based architecture and has a powerful and diverse set of peripherals. The Level 1 program cache (L1P) is a 128-Kbit direct mapped cache and the Level 1 data cache (L1D) is a 128-Kbit 2-way set-associative cache. The Level 2 memory/cache (L2) consists of an 8-Mbit memory space that is shared between program and data space. L2 memory can be configured as mapped memory or combinations of cache (up to 256K bytes) and mapped memory. The peripheral set includes three multichannel buffered serial ports (McBSPs); an 8-bit Universal Test and Operations PHY Interface for Asynchronous Transfer Mode (ATM) Slave [UTOPIA Slave] port (C6415/C6416 only); three 32-bit general-purpose timers; a user-configurable 16-bit or 32-bit host-port interface (HPI16/HPI32); a peripheral component interconnect (PCI) [C6415/C6416 only]; a general-purpose input/output port (GPIO) with 16 GPIO pins; and two glueless external memory interfaces (64-bit EMIFA and 16-bit EMIFB‡), both of which are capable of interfacing to synchronous and asynchronous memories and peripherals.

The C64x has a complete set of development tools which includes: an advanced C compiler with C64x-specific enhancements, an assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

All trademarks are the property of their respective owners.

† Throughout the remainder of this document, the TMS320C6414, TMS320C6415, and TMS320C6416 shall be referred to as TMS320C64x or C64x where generic, and where specific, their individual full device part numbers will be used or abbreviated as C6414, C6415, or C6416.

‡ These C64x™ devices have two EMIFs (64-bit EMIFA and 16-bit EMIFB). The prefix "A" in front of a signal name indicates it is an EMIFA signal whereas a prefix "B" in front of a signal name indicates it is an EMIFB signal. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix "A" or "B" may be omitted from the signal name.

[†] On these C64x™ devices, the rated EMIF speed affects only the SDRAM interface on EMIFA. For more detailed information, see the EMIF Device Speed section of this data sheet.

[‡] All devices are *now* at the Production Data (PD) stage of development.

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

device compatibility

The C64x™ generation of devices has a diverse and powerful set of peripherals. The common peripheral set and pin-compatibility that the C6414, C6415, and C6416 devices offer lead to easier system designs and faster time to market. Table 2 identifies the peripherals and coprocessors that are available on the C6414, C6415, and C6416 devices.

The C6414, C6415, and C6416 devices are pin-for-pin compatible, provided the following conditions are met:

- All devices are using the same peripherals.
The C6414 is pin-for-pin compatible with the C6415/C6416 when the PCI and UTOPIA peripherals on the C6415/C6416 are disabled.
The C6415 is pin-for-pin compatible with the C6416 when they are in the same peripheral selection mode.
[For more information on peripheral selection, see the Device Configurations section of this data sheet.]
- The BEA[9:7] pins are properly pulled up/down.
[For more details on the device-specific BEA[9:7] pin configurations, see the Terminal Functions table of this data sheet.]

Table 2. Peripherals and Coprocessors Available on the C6414, C6415, and C6416 Devices†‡

PERIPHERALS/COPROCESSORS	C6414	C6415	C6416
EMIFA (64-bit bus width)	√	√	√
EMIFB (16-bit bus width)	√	√	√

† — denotes peripheral/coprocessor is *not* available on this device.

‡ Not all peripherals pins are available at the same time. (For more details, see the Device Configuration section.)

For more detailed information on the device compatibility and similarities/differences among the C6414, C6415, and C6416 devices, see the *How To Begin Development Today With the TMS320C6414, TMS320C6415, and TMS320C6416 DSPs* application report (literature number SPRA718).

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

functional block and CPU (DSP core) diagram

† VCP and TCP decoder coprocessors are applicable to the C6416 device only.

‡ For the C6415 and C6416 devices, the UTOPIA peripheral is muxed with McBSP1, and the PCI peripheral is muxed with the HPI peripheral and the GPIO[15:9] port. For more details on the multiplexed pins of these peripherals, see the Device Configurations section of this data sheet.

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

CPU (DSP core) description

The CPU fetches VelociTI™ advanced very-long instruction words (VLIWs) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VelociTI™ VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C64x CPUs from other VLIW architectures. The C64x™ VelociTI.2™ extensions add enhancements to the TMS320C62x™ DSP VelociTI™ architecture. These enhancements include:

- Register file enhancements
- Data path extensions
- Quad 8-bit and dual 16-bit extensions with data flow enhancements
- Additional functional unit hardware
- Increased orthogonality of the instruction set
- Additional instructions that reduce code size and increase register flexibility

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 32 32-bit registers for a total of 64 general-purpose registers. In addition to supporting the packed 16-bit and 32-/40-bit fixed-point data types found in the C62x™ VelociTI™ VLIW architecture, the C64x™ register files also support packed 8-bit data and 64-bit fixed-point data types. The two sets of functional units, along with two register files, compose sides A and B of the CPU [see the functional block and CPU (DSP core) diagram, and Figure 1]. The four functional units on each side of the CPU can freely share the 32 registers belonging to that side. Additionally, each side features a “data cross path”—a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. The C64x CPU pipelines data-cross-path accesses over multiple clock cycles. This allows the same register to be used as a data-cross-path operand by multiple functional units in the same execute packet. All functional units in the C64x CPU can access operands via the data cross path. Register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle. On the C64x CPU, a delay clock is introduced whenever an instruction attempts to read a register via a data cross path if that register was updated in the previous clock cycle.

In addition to the C62x™ DSP fixed-point instructions, the C64x™ DSP includes a comprehensive collection of quad 8-bit and dual 16-bit instruction set extensions. These VelociTI.2™ extensions allow the C64x CPU to operate directly on packed data to streamline data flow and increase instruction set efficiency.

Another key feature of the C64x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C64x .D units can load and store bytes (8 bits), half-words (16 bits), and words (32 bits) with a single instruction. And with the new data path extensions, the C64x .D unit can load and store doublewords (64 bits) with a single instruction. Furthermore, the non-aligned load and store instructions allow the .D units to access words and doublewords on any byte boundary. The C64x CPU supports a variety of indirect addressing modes using either linear- or circular-addressing with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 64 registers. Some registers, however, are singled out to support specific addressing modes or to hold the condition for conditional instructions (if the condition is not automatically “true”).

TMS320C62x is a trademark of Texas Instruments.

CPU (DSP core) description (continued)

The two .M functional units perform all multiplication operations. Each of the C64x .M units can perform two 16×16 -bit multiplies or four 8×8 -bit multiplies per clock cycle. The .M unit can also perform 16×32 -bit multiply operations, dual 16×16 -bit multiplies with add/subtract operations, and quad 8×8 -bit multiplies with add operations. In addition to standard multiplies, the C64x .M units include bit-count, rotate, Galois field multiplies, and bidirectional variable shift hardware.

The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle. The arithmetic and logical functions on the C64x CPU include single 32-bit, dual 16-bit, and quad 8-bit operations.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are “linked” together by “1” bits in the least significant bit (LSB) position of the instructions. The instructions that are “chained” together for simultaneous execution (up to eight in total) compose an execute packet. A “0” in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. A C64x™ DSP device enhancement now allows execute packets to cross fetch-packet boundaries. In the TMS320C62x™/TMS320C67x™ DSP devices, if an execute packet crosses the fetch-packet boundary (256 bits wide), the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. In the C64x™ DSP device, the execute boundary restrictions have been removed, thereby, eliminating all of the NOPs added to pad the fetch packet, and thus, decreasing the overall code size. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes, half-words, words, or doublewords. All load and store instructions are byte-, half-word-, word-, or doubleword-addressable.

For more details on the C64x CPU functional units enhancements, see the following documents:

memory map summary

Table 3 shows the memory map address ranges of the TMS320C64x device. Internal memory is always located at address 0 and can be used as both program and data memory. The external memory address ranges in the C64x device begin at the hex address locations 0x6000 0000 for EMIFB and 0x8000 0000 for EMIFA.

memory map summary (continued)

Table 3. TMS320C64x Memory Map Summary

MEMORY BLOCK DESCRIPTION	BLOCK SIZE (BYTES)	HEX ADDRESS RANGE
Internal RAM (L2)	1M	0000 0000 – 000F FFFF
Reserved	23M	0010 0000 – 017F FFFF
External Memory Interface A (EMIFA) Registers	256K	0180 0000 – 0183 FFFF
L2 Registers	256K	0184 0000 – 0187 FFFF
HPI Registers	256K	0188 0000 – 018B FFFF
McBSP 0 Registers	256K	018C 0000 – 018F FFFF
McBSP 1 Registers	256K	0190 0000 – 0193 FFFF
Timer 0 Registers	256K	0194 0000 – 0197 FFFF
Timer 1 Registers	256K	0198 0000 – 019B FFFF
Interrupt Selector Registers	256K	019C 0000 – 019F FFFF
EDMA RAM and EDMA Registers	256K	01A0 0000 – 01A3 FFFF
McBSP 2 Registers	256K	01A4 0000 – 01A7 FFFF
EMIFB Registers	256K	01A8 0000 – 01AB FFFF
Timer 2 Registers	256K	01AC 0000 – 01AF FFFF
GPIO Registers	256K	01B0 0000 – 01B3 FFFF
UTOPIA Registers (C6415 and C6416 only) [†]	256K	01B4 0000 – 01B7 FFFF
TCP/VCP Registers (C6416 only) [‡]	256K	01B8 0000 – 01BB FFFF
Reserved	256K	01BC 0000 – 01BF FFFF
PCI Registers (C6415 and C6416 only) [†]	256K	01C0 0000 – 01C3 FFFF
Reserved	4M – 256K	01C4 0000 – 01FF FFFF
QDMA Registers	52	0200 0000 – 0200 0033
Reserved	736M – 52	0200 0034 – 2FFF FFFF
McBSP 0 Data	64M	3000 0000 – 33FF FFFF
McBSP 1 Data	64M	3400 0000 – 37FF FFFF
McBSP 2 Data	64M	3800 0000 – 3BFF FFFF
UTOPIA Queues (C6415 and C6416 only) [†]	64M	3C00 0000 – 3FFF FFFF
Reserved	256M	4000 0000 – 4FFF FFFF
TCP/VCP (C6416 only) [‡]	256M	5000 0000 – 5FFF FFFF
EMIFB CE0	64M	6000 0000 – 63FF FFFF
EMIFB CE1	64M	6400 0000 – 67FF FFFF

EMIFA CE1	256M	9000 0000 – 9FFF FFFF
EMIFA CE2	256M	A000 0000 – AFFF FFFF
EMIFA CE3	256M	B000 0000 – BFFF FFFF
Reserved	1G	C000 0000 – FFFF FFFF

[†] For the C6414 device, these memory address locations are reserved. The C6414 device does *not* support the UTOPIA and PCI peripherals.

[‡] Only the C6416 device supports the VCP/TCP Coprocessors. For the C6414 and C6415 devices, these memory address locations are reserved.

L2 architecture expanded

Figure 2 shows the detail of the L2 architecture on the TMS320C6414, TMS320C6415, and TMS320C6416 devices. For more information on the L2MODE bits, see the cache configuration (CCFG) register bit field descriptions in the *TMS320C64x Two-Level Internal Memory Reference Guide* (literature number SPRU610).

Figure 2. TMS320C6414/C6415/C6416 L2 Architecture Memory Configuration

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

peripheral register descriptions

Table 4 through Table 23 identify the peripheral registers for the C6414, C6415, and C6416 devices by their register names, acronyms, and hex address or hex address range. For more detailed information on the register contents, bit names and their descriptions, see the specific peripheral reference guide listed in the *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190).

Table 4. EMIFA Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
0180 0000	GBLCTL	EMIFA global control
0180 0004	CECTL1	EMIFA CE1 space control
0180 0008	CECTL0	EMIFA CE0 space control
0180 000C	-	Reserved
0180 0010	CECTL2	EMIFA CE2 space control
0180 0014	CECTL3	EMIFA CE3 space control
0180 0018	SDCTL	EMIFA SDRAM control
0180 001C	SDTIM	EMIFA SDRAM refresh control
0180 0020	SDEXT	EMIFA SDRAM extension
0180 0024 – 0180 003C	-	Reserved
0180 0040	PDTCTL	Peripheral device transfer (PDT) control
0180 0044	CESEC1	EMIFA CE1 space secondary control
0180 0048	CESEC0	EMIFA CE0 space secondary control
0180 004C	-	Reserved
0180 0050	CESEC2	EMIFA CE2 space secondary control
0180 0054	CESEC3	EMIFA CE3 space secondary control
0180 0058 – 0183 FFFF	-	Reserved

Table 5. EMIFB Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
01A8 0000	GBLCTL	EMIFB global control
01A8 0004	CECTL1	EMIFB CE1 space control
01A8 0008	CECTL0	EMIFB CE0 space control
01A8 000C	-	Reserved
01A8 0010	CECTL2	EMIFB CE2 space control
01A8 0014	CECTL3	EMIFB CE3 space control
01A8 0018	SDCTL	EMIFB SDRAM control
01A8 001C	SDTIM	EMIFB SDRAM refresh control
01A8 0020	SDEXT	EMIFB SDRAM extension
01A8 0024 – 01A8 003C	-	Reserved
01A8 0040	PDTCTL	Peripheral device transfer (PDT) control
01A8 0044	CESEC1	EMIFB CE1 space secondary control
01A8 0048	CESEC0	EMIFB CE0 space secondary control
01A8 004C	-	Reserved
01A8 0050	CESEC2	EMIFB CE2 space secondary control
01A8 0054	CESEC3	EMIFB CE3 space secondary control
01A8 0058 – 01AB FFFF	-	Reserved

5800 0028	01BA 0028	TCPIC10	TCP input configuration register 10
5800 002C	01BA 002C	TCPIC11	TCP input configuration register 11
5800 0030	01BA 0030	TCPOUT	TCP output parameters register
5802 0000	–	TCPSP	TCP systematics and parities memory
5804 0000	–	TCPEXT	TCP extrinsics memory
5806 0000	–	TCPAP	TCP apriori memory
5808 0000	–	TCPINTER	TCP interleaver memory
580A 0000	–	TCPHD	TCP hard decisions memory
–	01BA 0038	TCPEXE	TCP execution register
–	01BA 0040	TCPEND	TCP endian register
–	01BA 0050	TCPEXR	TCP error register
–	01BA 0058	TCPCSTAT	TCP status register

[‡] These TCP registers are supported on the C6416 device only.

EDMA channel synchronization events

The C64x EDMA supports up to 64 EDMA channels which service peripheral devices and external memory. Table 24 lists the source of C64x EDMA synchronization events associated with each of the programmable EDMA channels. For the C64x device, the association of an event to a channel is fixed; each of the EDMA channels has one specific event associated with it. These specific events are captured in the EDMA event registers (ERL, ERH) even if the events are disabled by the EDMA event enable registers (EERL, EERH). The priority of each event can be specified independently in the transfer parameters stored in the EDMA parameter RAM. For more detailed information on the EDMA module and how EDMA events are enabled, captured, processed, linked, chained, and cleared, etc., see the *TMS320C6000 DSP Enhanced Direct Memory Access (EDMA) Controller Reference Guide* (literature number SPRU234).

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

EDMA channel synchronization events (continued)

Table 24. TMS320C64x EDMA Channel Synchronization Events[†]

EDMA CHANNEL	EVENT NAME	EVENT DESCRIPTION
0	DSP_INT	HPI/PCI-to-DSP interrupt (PCI peripheral supported on C6415 and C6416 only) [‡]
1	TINT0	Timer 0 interrupt
2	TINT1	Timer 1 interrupt
3	SD_INTA	EMIFA SDRAM timer interrupt
4	GPINT4/EXT_INT4	GPIO event 4/External interrupt pin 4
5	GPINT5/EXT_INT5	GPIO event 5/External interrupt pin 5
6	GPINT6/EXT_INT6	GPIO event 6/External interrupt pin 6
7	GPINT7/EXT_INT7	GPIO event 7/External interrupt pin 7
8	GPINT0	GPIO event 0
9	GPINT1	GPIO event 1
10	GPINT2	GPIO event 2
11	GPINT3	GPIO event 3
12	XEVT0	McBSP0 transmit event
13	REVT0	McBSP0 receive event
14	XEVT1	McBSP1 transmit event
15	REVT1	McBSP1 receive event
16	–	None
17	XEVT2	McBSP2 transmit event
18	REVT2	McBSP2 receive event
19	TINT2	Timer 2 interrupt
20	SD_INTB	EMIFB SDRAM timer interrupt
21	–	Reserved, for future expansion
22–27	–	None
28	VCPREVT	VCP receive event (C6416 only) [§]
29	VCPXEVT	VCP transmit event (C6416 only) [§]
30	TCPREVT	TCP receive event (C6416 only) [§]
31	TCPXEVT	TCP transmit event (C6416 only) [§]
32	UREVT	UTOPIA receive event (C6415 and C6416 only) [‡]
33–39	–	None
40	UXEVT	UTOPIA transmit event (C6415 and C6416 only) [‡]
41–47	–	None
48	GPINT8	GPIO event 8
49	GPINT9	GPIO event 9
50	GPINT10	GPIO event 10
51	GPINT11	GPIO event 11
52	GPINT12	GPIO event 12
53	GPINT13	GPIO event 13
54	GPINT14	GPIO event 14
55	GPINT15	GPIO event 15
56–63	–	None

[†] In addition to the events shown in this table, each of the 64 channels can also be synchronized with the transfer completion or alternate transfer completion events. For more detailed information on EDMA event-transfer chaining, see the *TMS320C6000 DSP Enhanced Direct Memory Access (EDMA) Controller Reference Guide* (literature number SPRU234).

[‡] The PCI and UTOPIA peripherals are not supported on the C6414 device; therefore, these EDMA synchronization events are reserved.

[§] The VCP/TCP EDMA synchronization events are supported on the C6416 only. For the C6414 and C6415 devices, these events are reserved.

interrupt sources and interrupt selector

The C64x DSP core supports 16 prioritized interrupts, which are listed in Table 25. The highest-priority interrupt is INT_00 (dedicated to RESET) while the lowest-priority interrupt is INT_15. The first four interrupts (INT_00–INT_03) are non-maskable and fixed. The remaining interrupts (INT_04–INT_15) are maskable and default to the interrupt source specified in Table 25. The interrupt source for interrupts 4–15 can be programmed by modifying the selector value (binary value) in the corresponding fields of the Interrupt Selector Control registers: MUXH (address 0x019C0000) and MUXL (address 0x019C0004).

interrupt sources and interrupt selector (continued)

Table 25. C64x DSP Interrupts

CPU INTERRUPT NUMBER	INTERRUPT SELECTOR CONTROL REGISTER	SELECTOR VALUE (BINARY)	INTERRUPT EVENT	INTERRUPT SOURCE
INT_00†	–	–	RESET	
INT_01†	–	–	NMI	
INT_02†	–	–	Reserved	Reserved. Do not use.
INT_03†	–	–	Reserved	Reserved. Do not use.
INT_04‡	MUXL[4:0]	00100	GPINT4/EXT_INT4	GPIO interrupt 4/External interrupt pin 4
INT_05‡	MUXL[9:5]	00101	GPINT5/EXT_INT5	GPIO interrupt 5/External interrupt pin 5
INT_06‡	MUXL[14:10]	00110	GPINT6/EXT_INT6	GPIO interrupt 6/External interrupt pin 6
INT_07‡	MUXL[20:16]	00111	GPINT7/EXT_INT7	GPIO interrupt 7/External interrupt pin 7
INT_08‡	MUXL[25:21]	01000	EDMA_INT	EDMA channel (0 through 63) interrupt
INT_09‡	MUXL[30:26]	01001	EMU_DTDMA	EMU DTDMA
INT_10‡	MUXH[4:0]	00011	SD_INTA	EMIFA SDRAM timer interrupt
INT_11‡	MUXH[9:5]	01010	EMU_RTDXRX	EMU real-time data exchange (RTDX) receive
INT_12‡	MUXH[14:10]	01011	EMU_RTDXTX	EMU RTDX transmit
INT_13‡	MUXH[20:16]	00000	DSP_INT	HPI/PCI-to-DSP interrupt (PCI supported on C6415 and C6416 only)
INT_14‡	MUXH[25:21]	00001	TINT0	Timer 0 interrupt
INT_15‡	MUXH[30:26]	00010	TINT1	Timer 1 interrupt
–	–	01100	XINT0	McBSP0 transmit interrupt
–	–	01101	RINT0	McBSP0 receive interrupt
–	–	01110	XINT1	McBSP1 transmit interrupt
–	–	01111	RINT1	McBSP1 receive interrupt
–	–	10000	GPINT0	GPIO interrupt 0
–	–	10001	XINT2	McBSP2 transmit interrupt
–	–	10010	RINT2	McBSP2 receive interrupt
–	–	10011	TINT2	Timer 2 interrupt
–	–	10100	SD_INTB	EMIFB SDRAM timer interrupt
–	–	10101	Reserved	Reserved. Do not use.
–	–	10110	Reserved	Reserved. Do not use.
–	–	10111	UINT	UTOPIA interrupt (C6415/C6416 only)
–	–	11000 – 11101	Reserved	Reserved. Do not use.
–	–	11110	VCPINT	VCP interrupt (C6416 only)
–	–	11111	TCPINT	TCP interrupt (C6416 only)

† Interrupts INT_00 through INT_03 are non-maskable and fixed.

‡ Interrupts INT_04 through INT_15 are programmable by modifying the binary selector values in the Interrupt Selector Control registers fields. Table 25 shows the default interrupt sources for Interrupts INT_04 through INT_15. For more detailed information on interrupt sources and selection, see the *TMS320C6000 DSP Interrupt Selector Reference Guide* (literature number SPRU646).

signal groups description

† These pins are muxed with the GPIO port pins and by default these signals function as clocks (CLKOUT4 or CLKOUT6) or McBSP2 clock source (CLKS2). To use these muxed pins as GPIO signals, the appropriate GPIO register bits (GPxEN and GPxDIR) must be properly enabled and configured. For more details, see the Device Configurations section of this data sheet.

‡ These pins are GPIO pins that can also function as external interrupt sources (EXT_INT[7:4]). Default after reset is EXT_INTx or GPIO as input-only.

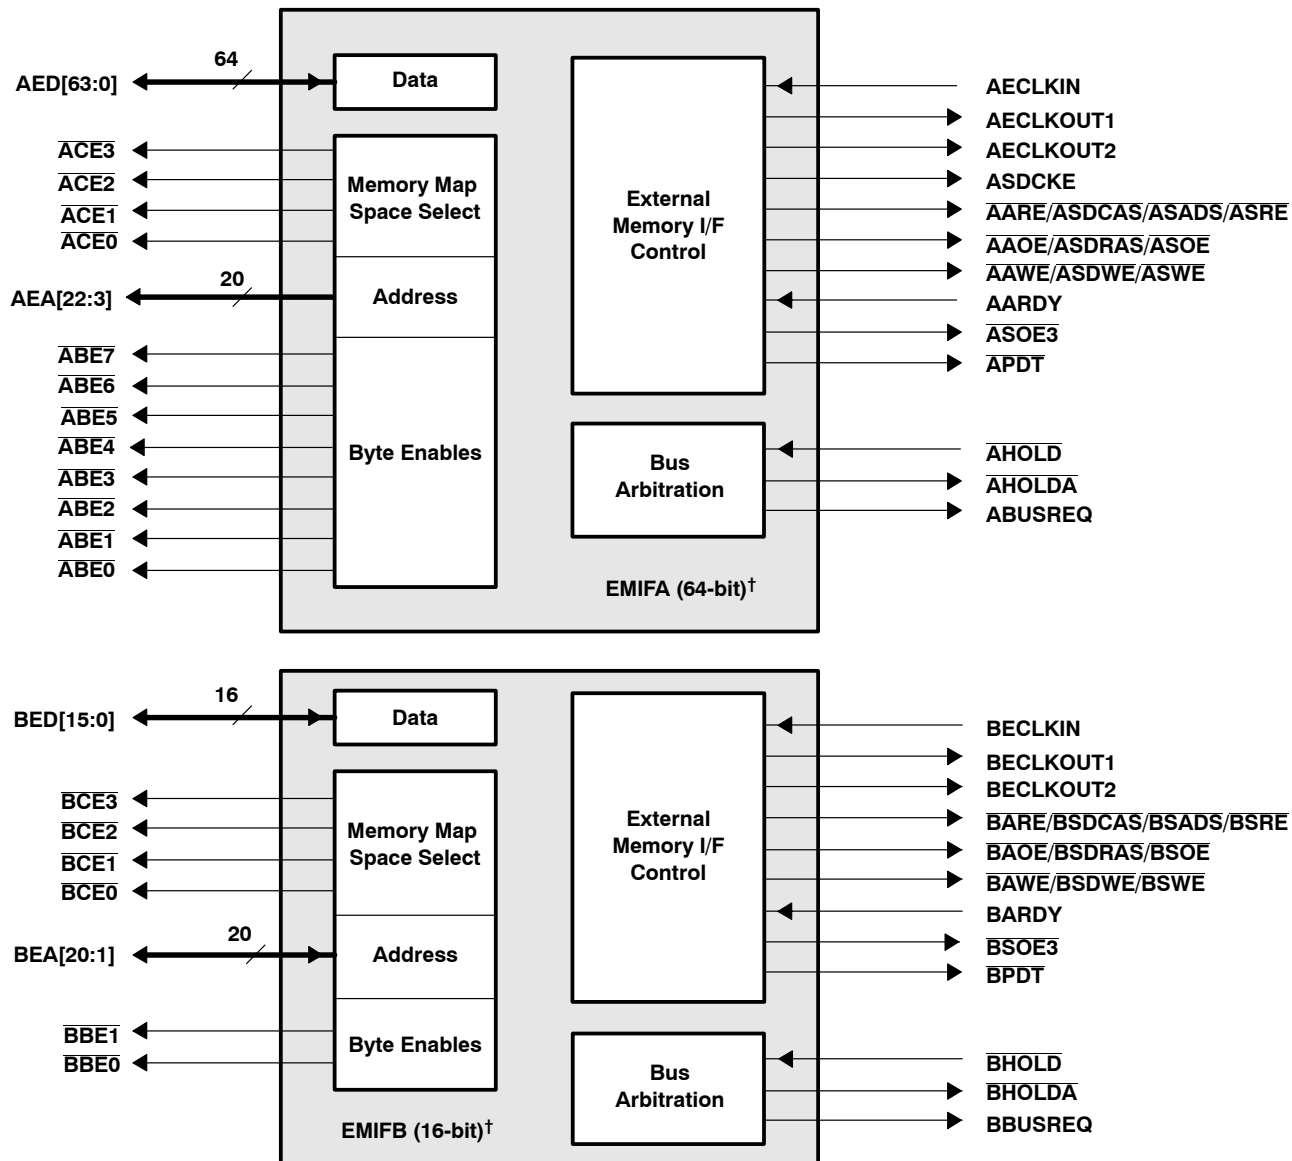

§ For the C6415 and C6416 devices, these GPIO pins are muxed with the PCI peripheral pins. By default, these signals are set up to no function with both the GPIO and PCI pin functions *disabled*. For more details on these muxed pins, see the Device Configurations section of this data sheet. For the C6414 device, the GPIO peripheral pins are *not* muxed; the C6414 device does *not* support the PCI peripheral.

Figure 3. CPU and Peripheral Signals

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

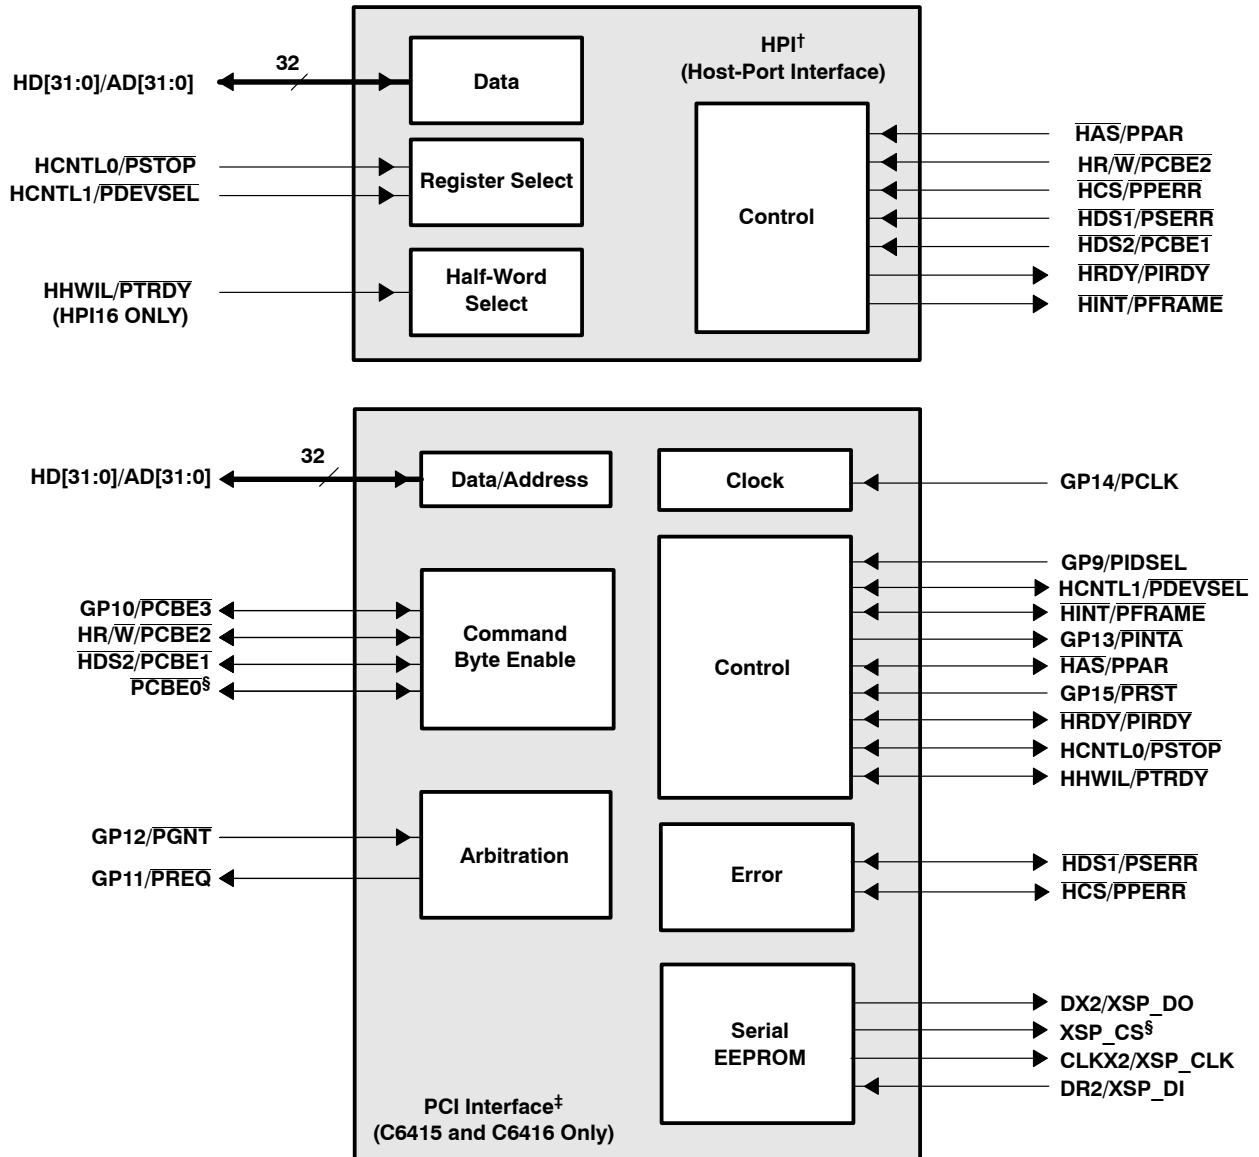

signal groups description (continued)

† These C64x™ devices have two EMIFs (64-bit EMIFA and 16-bit EMIFB). The prefix "A" in front of a signal name indicates it is an EMIFA signal whereas a prefix "B" in front of a signal name indicates it is an EMIFB signal. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix "A" or "B" may be omitted from the signal name.

Figure 4. Peripheral Signals

signal groups description (continued)

† For the C6415 and C6416 devices, these HPI pins are muxed with the PCI peripheral. By default, these signals function as HPI. For more details on these muxed pins, see the Device Configurations section of this data sheet. For the C6414 device, these HPI pins are *not* muxed; the C6414 device does *not* support the PCI peripheral.

‡ For the C6415 and C6416 devices, these PCI pins (excluding $\overline{PCBE0}$ and XSP_CS) are muxed with the HPI, McBSP2, or GPIO peripherals. By default, these signals function as HPI, McBSP2, and no function, respectively. For more details on these muxed pins, see the Device Configurations section of this data sheet. For the C6414 device, the HPI, McBSP2, and GPIO peripheral pins are *not* muxed; the C6414 device does *not* support the PCI peripheral.

§ For the C6414 device, these pins are "Reserved (leave unconnected, *do not* connect to power or ground)."

Figure 4. Peripheral Signals (Continued)

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

DEVICE CONFIGURATIONS

The C6414, C6415, and C6416 peripheral selections and other device configurations are determined by external pullup/pulldown resistors on the following pins (all of which are latched during device reset):

- peripherals selection (C6415 and C6416 devices)
 - BEA11 (UTOPIA_EN)
 - PCI_EN (for C6415 or C6416, see Table 27 footnotes)
 - MCBSP2_EN (for C6415 or C6416, see Table 27 footnotes)

The C6414 device does *not* support the PCI and UTOPIA peripherals; for proper operation of the C6414 device, do *not* oppose the internal *pulldowns* (IPDs) on the BEA11, PCI_EN, and MCBSP2_EN pins. (For IPU/IPDs on pins, see the Terminal Functions table of this data sheet.)

- other device configurations (C64x)
 - BEA[20:13, 7]
 - HD5

peripherals selection

Some C6415/C6416 peripherals share the same pins (internally muxed) and are mutually exclusive (i.e., HPI, general-purpose input/output pins GP[15:9], PCI and its internal EEPROM, McBSP1, McBSP2, and UTOPIA). The VCP/TCP coprocessors (C6416 only) and other C64x peripherals (i.e., the Timers, McBSP0, and the GP[8:0] pins), are always available.

- UTOPIA and McBSP1 peripherals

The UTOPIA_EN pin (BEA11) is latched at reset. For C6415 and C6416 devices, this pin selects whether the UTOPIA peripheral or McBSP1 peripheral is functionally enabled (see Table 26).

The C6414 device does *not* support the UTOPIA peripheral; for proper device operation, do *not* oppose the internal *pulldown* (IPD) on the BEA11 pin.

Table 26. UTOPIA_EN Peripheral Selection (McBSP1 and UTOPIA) (C6415/C6416 Only)

PERIPHERAL SELECTION UTOPIA_EN (BEA11) Pin [D16]	PERIPHERALS SELECTED		DESCRIPTION
	UTOPIA	McBSP1	
0		√	McBSP1 is enabled and UTOPIA is disabled [default]. This means all multiplexed McBSP1/UTOPIA pins function as McBSP1 and all other standalone UTOPIA pins are tied-off (Hi-Z).
1	√		UTOPIA is enabled and McBSP1 is disabled. This means all multiplexed McBSP1/UTOPIA pins now function as UTOPIA and all other standalone McBSP1 pins are tied-off (Hi-Z).

- HPI, GP[15:9], PCI, EEPROM (internal to PCI), and McBSP2 peripherals

The PCI_EN and MCBSP2_EN pins are latched at reset. They determine specific peripheral selection for the C6415 and C6416 devices, summarized in Table 27.

The C6414 device does *not* support the PCI peripheral; for proper device operation, do *not* oppose the internal pulldowns (IPDs) on the PCI_EN and MCBSP2_EN pins.

DEVICE CONFIGURATIONS (CONTINUED)

Table 27. PCI_EN and MCBSP2_EN Peripheral Selection (HPI, GP[15:9], PCI, and McBSP2)

PERIPHERAL SELECTION [†]		PERIPHERALS SELECTED				
PCI_EN Pin [AA4]	MCBSP2_EN Pin [AF3]	HPI	GP[15:9]	PCI	EEPROM (Internal to PCI)	McBSP2
0	0	√	√			√
0	1	√	√			√
1	0			√	√	‡
1	1			√		√

[†] The PCI_EN pin *must* be driven valid at all times and the user *must not* switch values throughout device operation.

The MCBSP2_EN pin *must* be driven valid at all times and the user *can* switch values throughout device operation.

[‡] The only time McBSP2 is disabled is when both PCI_EN = 1 and MCBSP2_EN = 0. This configuration enables, at reset, the auto-initialization of the PCI peripheral through the PCI internal EEPROM [provided the PCI EEPROM Auto-Initialization pin (BEA13) is pulled up (EEAI = 1)]. The user can then enable the McBSP2 peripheral (disabling EEPROM) by dynamically changing MCBSP2_EN to a "1" after the device is initialized (out of reset).

- If the PCI is disabled (PCI_EN = 0), the HPI peripheral is enabled and GP[15:9] pins can be programmed as GPIO, provided the GPxEN and GPxDIR bits are properly configured.

This means all multiplexed HPI/PCI pins function as HPI and all standalone PCI pins ($\overline{PCBE0}$ and XSP_CS) are tied-off (Hi-Z). Also, the multiplexed GPIO/PCI pins can be used as GPIO with the proper software configuration of the GPIO enable and direction registers (for more details, see Table 29).

- If the PCI is enabled (PCI_EN = 1), the HPI peripheral is disabled.

This means all multiplexed HPI/PCI pins function as PCI. Also, the multiplexed GPIO/PCI pins function as PCI pins (for more details, see Table 29).

- The MCBSP2_EN pin, in combination with the PCI_EN pin, controls the selection of the McBSP2 peripheral and the PCI internal EEPROM (for more details, see Table 27 and its footnotes).

other device configurations

Table 28 describes the C6414, C6415, and C6416 devices configuration pins, which are set up via external pullup/pulldown resistors through the specified EMIFB address bus pins (BEA[20:13, 11, 9:7]) and the HD5 pin. For more details on these device configuration pins, see the Terminal Functions table and the Debugging Considerations section.

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

DEVICE CONFIGURATIONS (CONTINUED)

Table 28. Device Configuration Pins (BEA[20:13, 9:7], HD5, and BEA11)

CONFIGURATION PIN	NO.	FUNCTIONAL DESCRIPTION
BEA20	E16	Device Endian mode (LEND) 0 – System operates in Big Endian mode 1 – System operates in Little Endian mode (default)
BEA[19:18]	[D18, C18]	Bootmode [1:0] 00 – No boot 01 – HPI boot 10 – EMIFB 8-bit ROM boot with default timings (default mode) 11 – Reserved
BEA[17:16]	[B18, A18]	EMIFA input clock select Clock mode select for EMIFA (AECLKIN_SEL[1:0]) 00 – AECLKIN (default mode) 01 – CPU/4 Clock Rate 10 – CPU/6 Clock Rate 11 – Reserved
BEA[15:14]	[D17, C17]	EMIFB input clock select Clock mode select for EMIFB (BECLKIN_SEL[1:0]) 00 – BECLKIN (default mode) 01 – CPU/4 Clock Rate 10 – CPU/6 Clock Rate 11 – Reserved
BEA13	B17	PCI EEPROM Auto-Initialization (EEAI) [C6415 and C6416 devices only] [The C6414 device does <i>not</i> support the PCI peripheral; for proper device operation, do not oppose the internal pulldown (IPD) on the BEA13 pin.] PCI auto-initialization via external EEPROM 0 – PCI auto-initialization through EEPROM is disabled; the PCI peripheral uses the specified PCI default values (default). 1 – PCI auto-initialization through EEPROM is enabled; the PCI peripheral is configured through EEPROM provided the PCI peripheral pin is enabled (PCI_EN = 1) and the McBSP2 peripheral pin is disabled (MCBSP2_EN = 0). Note: If the PCI peripheral is disabled (PCI_EN pin = 0), this pin must not be pulled up. For more information on the PCI EEPROM default values, see the <i>TMS320C6000 DSP Peripheral Component Interconnect (PCI) Reference Guide</i> (literature number SPRU581).
BEA11	D16	UTOPIA Enable (UTOPIA_EN) [C6415 and C6416 devices only] [The C6414 device does <i>not</i> support the UTOPIA peripheral; for proper device operation, do not oppose the internal pulldown (IPD) on the BEA11 pin.] UTOPIA peripheral enable (functional) 0 – UTOPIA peripheral disabled (McBSP1 functions are enabled). [default] This means all multiplexed McBSP1/UTOPIA pins function as McBSP1 and all other standalone UTOPIA pins are tied-off (Hi-Z). 1 – UTOPIA peripheral enabled (McBSP1 functions are disabled). This means all multiplexed McBSP1/UTOPIA pins now function as UTOPIA and all other standalone McBSP1 pins are tied-off (Hi-Z).

DEVICE CONFIGURATIONS (CONTINUED)

Table 28. Device Configuration Pins (BEA[20:13, 9:7], HD5, and BEA11) (Continued)

CONFIGURATION PIN	NO.	FUNCTIONAL DESCRIPTION		
		C6414 Devices	C6415 Devices	C6416 Devices
BEA7 BEA8 BEA9	D15 A16 B16	Do not oppose internal pulldown (IPD) Do not oppose IPD Do not oppose IPD	Pullup [†] Do not oppose IPD Do not oppose IPD	Do not oppose IPD Pullup [†] Pullup [†]
†For proper device operation, this pin must be externally pulled up with a 1-kΩ resistor.				
HD5	Y1	HPI peripheral bus width (HPI_WIDTH) 0 – HPI operates as an HPI16. (HPI bus is 16 bits wide. HD[15:0] pins are used and the remaining HD[31:16] pins are reserved pins in the Hi-Z state.) 1 – HPI operates as an HPI32. (HPI bus is 32 bits wide. All HD[31:0] pins are used for host-port operations.)		

DEVICE CONFIGURATIONS (CONTINUED)

multiplexed pins

Multiplexed pins are pins that are shared by more than one peripheral and are internally multiplexed. Some of these pins are configured by software, and the others are configured by external pullup/pulldown resistors only at reset. Those muxed pins that are configured by software can be programmed to switch functionalities at any time. Those muxed pins that are configured by external pullup/pulldown resistors are mutually exclusive; only one peripheral has primary control of the function of these pins after reset. Table 29 identifies the multiplexed pins on the C6414, C6415, and C6416 devices; shows the default (primary) function and the default settings after reset; and describes the pins, registers, etc. necessary to configure specific multiplexed functions.

debugging considerations

It is recommended that external connections be provided to device configuration pins, including CLKMODE[1:0], BEA[20:13, 11, 9:7], HD5/AD5, PCI_EN, and MCBSP2_EN. Although internal pullup/pulldown resistors exist on these pins (except for HD5/AD5), providing external connectivity adds convenience to the user in debugging and flexibility in switching operating modes.

Internal pullup/pulldown resistors also exist on the non-configuration pins on the BEA bus (BEA[12, 10, 6:1]). Do not oppose the internal pullup/pulldown resistors on these non-configuration pins with external pullup/pulldown resistors. If an external controller provides signals to these non-configuration pins, these signals must be driven to the default state of the pins at reset, or not be driven at all.

For the internal pullup/pulldown resistors on the C6414, C6415, and C6416 device pins, see the terminal functions table.

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

Terminal Functions (Continued)

SIGNAL NAME	NO.	TYPE†	IPD/ IPU‡	DESCRIPTION
RESETS, INTERRUPTS, AND GENERAL-PURPOSE INPUT/OUTPUTS				
RESET	AC7	I		Device reset
NMI	B4	I	IPD	Nonmaskable interrupt, edge-driven (rising edge)
GP7/EXT_INT7	AF4	I/O/Z	IPU	General-purpose input/output (GPIO) pins (I/O/Z) or external interrupts (input only). The default after reset setting is GPIO enabled as input-only. <ul style="list-style-type: none"> • When these pins function as External Interrupts [by selecting the corresponding interrupt enable register bit (IER.[7:4])], they are edge-driven and the polarity can be independently selected via the External Interrupt Polarity Register bits (EXTPOL.[3:0]).
GP6/EXT_INT6	AD5			
GP5/EXT_INT5	AE5			
GP4/EXT_INT4	AF5			
GP15/PRST§	G3	I/O/Z		General-purpose input/output (GPIO) 15 pin (I/O/Z) or PCI reset (I). No function at default.
GP14/PCLK§	F2		GPIO 14 pin (I/O/Z) or PCI clock (I). No function at default.	
GP13/PINTA§	G4		GPIO 13 pin (I/O/Z) or PCI interrupt A (O/Z). No function at default.	
GP12/PGNT§	J3		GPIO 12 pin (I/O/Z) or PCI bus grant (I). No function at default.	
GP11/PREQ§	F1		GPIO 11 pin (I/O/Z) or PCI bus request (O/Z). No function at default.	
GP10/PCBE3§	L2		GPIO 10 pin (I/O/Z) or PCI command/byte enable 3 (I/O/Z). No function at default.	
GP9/PIDSEL§	M3		GPIO 9 pin (I/O/Z) or PCI initialization device select (I). No function at default.	
GP3	AC6		IPD	GPIO 3 pin (I/O/Z). The default after reset setting is GPIO 3 enabled as input-only.
GP0	AF6		IPD	GPIO 0 pin. The general-purpose I/O 0 pin (GPIO 0) (I/O/Z) can be programmed as GPIO 0 (input only) [default] or as GPIO 0 (output only) pin or output as a general-purpose interrupt (GPOINT) signal (output only).
CLKS2/GP8§¶	AE4		I/O/Z	IPD
CLKOUT6/GP2§¶	AD6	I/O/Z	IPD	Clock output at 1/6 of the device speed (O/Z) [default] or this pin can be programmed as a GPIO 2 pin (I/O/Z).
CLKOUT4/GP1§¶	AE6	I/O/Z	IPD	Clock output at 1/4 of the device speed (O/Z) [default] or this pin can be programmed as a GPIO 1 pin (I/O/Z).
HOST-PORT INTERFACE (HPI) [C64x] or PERIPHERAL COMPONENT INTERCONNECT (PCI) [C6415 or C6416 devices only]				
PCI_EN	AA4	I	IPD	PCI enable pin. This pin controls the selection (enable/disable) of the HPI and GP[15:9], or PCI peripherals (for the C6415 and C6416 devices). This pin works in conjunction with the MCBSP2_EN pin to enable/disable other peripherals (for more details, see the Device Configurations section of this data sheet). The C6414 device does <i>not</i> support the PCI peripheral; for proper device operation, do <i>not</i> oppose the internal pulldown (IPD) on this pin.
HINT/PFRAME§	R4	I/O/Z		Host interrupt from DSP to host (O) [default] or PCI frame (I/O/Z)
HCNTL1/ PDEVSEL§	R1	I/O/Z		Host control – selects between control, address, or data registers (I) [default] or PCI device select (I/O/Z).
HCNTL0/ PSTOP§	T4	I/O/Z		Host control – selects between control, address, or data registers (I) [default] or PCI stop (I/O/Z)
HHWIL/PTRDY§	R3	I/O/Z		Host half-word select – first or second half-word (not necessarily high or low order) [For HPI16 bus width selection only] (I) [default] or PCI target ready (I/O/Z)
HR/W/PCBE2§	P1	I/O/Z		Host read or write select (I) [default] or PCI command/byte enable 2 (I/O/Z)

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

§ For the C6415 and C6416 devices, these pins are multiplexed pins. For more details, see the Device Configurations section of this data sheet. The C6414 device does *not* support the PCI or UTOPIA peripherals; therefore, these muxed peripheral pins are standalone peripheral functions for this device.

¶ For the C6414 device, only these pins are multiplexed pins.

BED0	B10			
MULTICHANNEL BUFFERED SERIAL PORT 2 (McBSP2)				
MCBSP2_EN	AF3	I	IPD	McBSP2 enable pin. This pin works in conjunction with the PCI_EN pin to enable/disable other peripherals (for more details, see the Device Configurations section of this data sheet).
CLKS2/GP8 [§]	AE4	I/O/Z	IPD	McBSP2 external clock source (CLKS2) [input only] [default] or this pin can also be programmed as a GPIO 8 pin (I/O/Z).
CLKR2	AB1	I/O/Z	IPD	McBSP2 receive clock. When McBSP2 is disabled (PCI_EN = 1 and MCBSP2_EN pin = 0), this pin is tied-off.
CLKX2/ XSP_CLK [§]	AC2	I/O/Z	IPD	McBSP2 transmit clock (I/O/Z) [default] or PCI serial interface clock (O).
DR2/XSP_DI [§]	AB3	I	IPU	McBSP2 receive data (I) [default] or PCI serial interface data in (I). In PCI mode, this pin is connected to the output data pin of the serial PROM.
DX2/XSP_DO [§]	AA2	O/Z	IPU	McBSP2 transmit data (O/Z) [default] or PCI serial interface data out (O). In PCI mode, this pin is connected to the input data pin of the serial PROM.
FSR2	AC1	I/O/Z	IPD	McBSP2 receive frame sync. When McBSP2 is disabled (PCI_EN = 1 and MCBSP2_EN pin = 0), this pin is tied-off.
FSX2	AB2	I/O/Z	IPD	McBSP2 transmit frame sync. When McBSP2 is disabled (PCI_EN = 1 and MCBSP2_EN pin = 0), this pin is tied-off.

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

§ For the C6415 and C6416 devices, these pins are multiplexed pins. For more details, see the Device Configurations section of this data sheet. The C6414 device does *not* support the PCI or UTOPIA peripherals; therefore, these muxed peripheral pins except CLKS2/GP8 are standalone peripheral functions for this device.

|| These C64x™ devices have two EMIFs (64-bit EMIFA and 16-bit EMIFB). The prefix “A” in front of a signal name indicates it is an EMIFA signal whereas a prefix “B” in front of a signal name indicates it is an EMIFB signal. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix “A” or “B” may be omitted from the signal name.

* To maintain signal integrity for the EMIF signals, serial termination resistors should be inserted into all EMIF output signal lines.

SIGNAL NAME	NO.	TYPE†	IPD/ IPU‡	DESCRIPTION
UNIVERSAL TEST AND OPERATIONS PHY INTERFACE FOR ASYNCHRONOUS TRANSFER MODE (ATM) [UTOPIA SLAVE] [C6415 and C6416 devices only]				
UTOPIA SLAVE (ATM CONTROLLER) – TRANSMIT INTERFACE				
UXCLK ^ψ	AD11	I	□	Source clock for UTOPIA transmit driven by Master ATM Controller. When the UTOPIA peripheral is disabled (UTOPIA_EN [BEA11 pin] = 0), this pin is tied-off.
UXCLAV ^ψ	AC14	O/Z		Transmit cell available status output signal from UTOPIA Slave. 0 indicates a complete cell is NOT available for transmit 1 indicates a complete cell is available for transmit When the UTOPIA peripheral is disabled (UTOPIA_EN [BEA11 pin] = 0), this pin is tied-off.
UXENB ^ψ	AE15	I	◇	UTOPIA transmit interface enable input signal. Asserted by the Master ATM Controller to indicate that the UTOPIA Slave should put out on the Transmit Data Bus the first byte of valid data and the UXSOC signal in the next clock cycle. When the UTOPIA peripheral is disabled (UTOPIA_EN [BEA11 pin] = 0), this pin is tied-off.
UXSOC ^ψ	AC13	O/Z		Transmit Start-of-Cell signal. This signal is output by the UTOPIA Slave on the rising edge of the UXCLK, indicating that the first valid byte of the cell is available on the 8-bit Transmit Data Bus (UXDATA[7:0]). When the UTOPIA peripheral is disabled (UTOPIA_EN [BEA11 pin] = 0), this pin is tied-off.
DX1/ UXADDR4 [§]	AB11	I/O/Z	◇	McBSP1 [default] or UTOPIA transmit address pins As UTOPIA transmit address pins UXADDR[4:0] (I), UTOPIA_EN (BEA11 pin) = 1: <ul style="list-style-type: none"> • 5-bit Slave transmit address input pins driven by the Master ATM Controller to identify and select one of the Slave devices (up to 31 possible) in the ATM System. • UXADDR0 pin is tied off when the UTOPIA peripheral is disabled [UTOPIA_EN (BEA11 pin) = 0] For the McBSP1 pin functions (UTOPIA_EN (BEA11 pin) = 0 [default]), see the MULTICHANNEL BUFFERED SERIAL PORT 1 (McBSP1) section of this table.
FSX1/ UXADDR3 [§]	AB13	I/O/Z	◇	McBSP1 [default] or UTOPIA transmit address pins As UTOPIA transmit address pins UXADDR[4:0] (I), UTOPIA_EN (BEA11 pin) = 1: <ul style="list-style-type: none"> • 5-bit Slave transmit address input pins driven by the Master ATM Controller to identify and select one of the Slave devices (up to 31 possible) in the ATM System.
FSR1/ UXADDR2 [§]	AC9	I/O/Z	◇	<ul style="list-style-type: none"> • UXADDR0 pin is tied off when the UTOPIA peripheral is disabled [UTOPIA_EN (BEA11 pin) = 0]
DR1/ UXADDR1 [§]	AF11	I	◇	
UXADDR0 ^ψ	AE9	I	◇	For the McBSP1 pin functions (UTOPIA_EN (BEA11 pin) = 0 [default]), see the MULTICHANNEL BUFFERED SERIAL PORT 1 (McBSP1) section of this table.

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

§ For the C6415 and C6416 devices, these pins are multiplexed pins. For more details, see the Device Configurations section of this data sheet. The C6414 device does *not* support the PCI or UTOPIA peripherals; therefore, these muxed peripheral pins are standalone peripheral functions for this device.

□ For the C6415 and C6416 devices, external pulldowns required: *If* UTOPIA is selected (BEA11 = 1) *and* these pins are connected to other devices, then a 10-kΩ resistor must be used to **externally** pull down each of these pins. If these pins are “no connects”, then only UXCLK and URCLK need to be pulled down and other pulldowns are not necessary.

◇ For the C6415 and C6416 devices, external pullups required: *If* UTOPIA is selected (BEA11 = 1) *and* these pins are connected to other devices, then a 10-kΩ resistor must be used to **externally** pull up each of these pins. If these pins are “no connects”, then the pullups are not necessary.

ψ The C6414 device does not support the UTOPIA peripheral; therefore, these standalone UTOPIA pins are **Reserved** (leave unconnected, **do not** connect to power or ground) with the exception of UXCLK and URCLK which should be connected to a 10-kΩ pulldown resistor (see the square [□] footnote).

development support

TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000™ DSP-based applications:

Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE): including Editor

C/C++/Assembly Code Generation, and Debug plus additional development tools

Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DSP application.

Hardware Development Tools:

Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug)

EVM (Evaluation Module)

For a complete listing of development-support tools for the TMS320C6000™ DSP platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

Code Composer Studio, DSP/BIOS, and XDS are trademarks of Texas Instruments.

device support

device and development-support tool nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (i.e., **TMS320C6412GTS600**) Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

TMX Experimental device that is not necessarily representative of the final device's electrical specifications

TMP Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification

TMS Fully qualified production device

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing

TMDS Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GLZ), the temperature range (for example, blank is the default commercial temperature range), and the device speed range in megahertz (for example, -6E3 is 600-MHz CPU, 133-MHz EMIFA). Figure 5 provides a legend for reading the complete device name for any TMS320C64x™ DSP generation member.

The ZLZ package, like the GLZ package, is a 532-pin plastic BGA *only* with lead-free soldered balls. The CLZ package, like the GLZ package, is a 532-pin plastic BGA *only* with lead-free bump and lead-free soldered balls. The ZLZ and CLZ package types are available upon request. For device part numbers and further ordering information for TMS320C6414/C6415/C6416 in the GLZ, ZLZ and CLZ package types, see the TI website (<http://www.ti.com>) or contact your TI sales representative.

documentation support

Extensive documentation supports all TMS320™ DSP family generations of devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000™ DSP devices:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the C6000™ DSP CPU (core) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190) provides an overview and briefly describes the functionality of the peripherals available on the C6000™ DSP platform of devices. This document also includes a table listing the peripherals available on the C6000 devices along with literature numbers and hyperlinks to the associated peripheral documents.

The *TMS320C64x Technical Overview* (literature number SPRU395) gives an introduction to the C64x™ digital signal processor, and discusses the application areas that are enhanced by the C64x™ DSP Velocity™ VLIW architecture.

The *TMS320C6414, TMS320C6415, and TMS320C6416 Digital Signal Processors Silicon Errata* (literature number SPRZ011) describes the known exceptions to the functional specifications for the TMS320C6414, TMS320C6415, and TMS320C6416 devices.

The *TMS320C6414/15/16 Power Consumption Summary* application report (literature number SPRA811) discusses the power consumption for user applications with the TMS320C6414, TMS320C6415, and TMS320C6416 DSP devices.

The *Using IBIS Models for Timing Analysis* application report (literature number SPRA839) describes how to properly use IBIS models to attain accurate timing analysis for a given system.

The *How To Begin Development Today With the TMS320C6414, TMS320C6415, and TMS320C6416 DSPs* application report (literature number SPRA718) describes in more detail the compatibility and similarities/differences among the C6414, C6415, C6416, and C6211 devices.

The tools support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE). For a complete listing of C6000™ DSP latest documentation, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL).

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

clock PLL

Most of the internal C64x™ DSP clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which multiplies the source clock frequency to generate the internal CPU clock, or bypasses the PLL to become the internal CPU clock.

To use the PLL to generate the CPU clock, the external PLL filter circuit must be properly designed. Figure 6 shows the external PLL circuitry for either x1 (PLL bypass) or other PLL multiply modes.

To minimize the clock jitter, a single clean power supply should power both the C64x™ DSP device and the external clock oscillator circuit. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see the *input and output clocks* electricals section.

Rise/fall times, duty cycles (high/low pulse durations), and the load capacitance of the external clock source must meet the DSP requirements in this data sheet (see the *electrical characteristics over recommended ranges of supply voltage and operating case temperature* table and the *input and output clocks* electricals section). Table 30 lists some examples of compatible CLKIN external clock sources:

Table 30. Compatible CLKIN External Clock Sources

COMPATIBLE PARTS FOR EXTERNAL CLOCK SOURCES (CLKIN)	PART NUMBER	MANUFACTURER
Oscillators	JITO-2	Fox Electronix
	STA series, ST4100 series	SaRonix Corporation
	SG-636	Epson America
	342	Corning Frequency Control
PLL	ICS525-02	Integrated Circuit Systems
Spread Spectrum Clock Generator	MK1714	

clock PLL (continued)

(For the PLL Options, CLKMODE Pins Setup, and PLL Clock Frequency Ranges, see Table 31.)

- NOTES:
- A. Place all PLL external components (C1, C2, and the EMI Filter) as close to the C6000™ DSP device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown.
 - B. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (C1, C2, and the EMI Filter).
 - C. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV_{DD}.
 - D. EMI filter manufacturer TDK part number ACF451832-333, -223, -153, -103. Panasonic part number EXCCET103U.

Figure 6. External PLL Circuitry for Either PLL Multiply Modes or x1 (Bypass) Mode

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

clock PLL (continued)

Table 31. TMS320C64x PLL Multiply Factor Options, Clock Frequency Ranges, and Typical Lock Time^{†‡}

GLZ, ZLZ and CLZ PACKAGES – 23 x 23 mm BGA							
CLKMODE1	CLKMODE0	CLKMODE (PLL MULTIPLY FACTORS)	CLKIN RANGE (MHz)	CPU CLOCK FREQUENCY RANGE (MHz)	CLKOUT4 RANGE (MHz)	CLKOUT6 RANGE (MHz)	TYPICAL LOCK TIME (μ s) [§]
0	0	Bypass (x1)	30–75.75	30–75.75	7.5–18.9	5–12.6	N/A
0	1	x6	30–75.75	180–454.5	45–113.6	30–75.75	75
1	0	x12	30–60.6	360–727.2	90–181.8	60–121.2	
1	1	Reserved	–	–	–	–	–

[†] These clock frequency range values are applicable to a C64x–6E3 speed device. For –5E0 and –7E3 device speed values, see the CLKIN timing requirements table for the specific device speed.

[‡] Use external pullup resistors on the CLKMODE pins (CLKMODE1 and CLKMODE0) to set the C64x device to one of the valid PLL multiply clock modes (x6 or x12). With internal pulldown resistors on the CLKMODE pins (CLKMODE1, CLKMODE0), the default clock mode is x1 (bypass).

[§] Under some operating conditions, the maximum PLL lock time may vary by as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100 μ s, the maximum value may be as long as 250 μ s.

general-purpose input/output (GPIO)

To use the GP[15:0] software-configurable GPIO pins, the GPxEN bits in the GP Enable (GPEN) Register and the GPxDIR bits in the GP Direction (GPDIR) Register must be properly configured.

- GPxEN = 1 GP[x] pin is enabled
- GPxDIR = 0 GP[x] pin is an input
- GPxDIR = 1 GP[x] pin is an output

where “x” represents one of the 15 through 0 GPIO pins

Figure 7 shows the GPIO enable bits in the GPEN register for the C6414/C6415/C6416 device. To use any of the GPx pins as general-purpose input/output functions, the corresponding GPxEN bit must be set to “1” (enabled). Default values are device-specific, so refer to Figure 7 for the C6414/15/16 default configuration.

Legend: R/W = Readable/Writeable; -n = value after reset, -x = undefined value after reset

Figure 7. GPIO Enable Register (GPEN) [Hex Address: 01B0 0000]

Figure 8 shows the GPIO direction bits in the GPDIR register. This register determines if a given GPIO pin is an input or an output providing the corresponding GPxEN bit is enabled (set to “1”) in the GPEN register. By default, all the GPIO pins are configured as input pins.

Legend: R/W = Readable/Writeable; -n = value after reset, -x = undefined value after reset

Figure 8. GPIO Direction Register (GPDIR) [Hex Address: 01B0 0004]

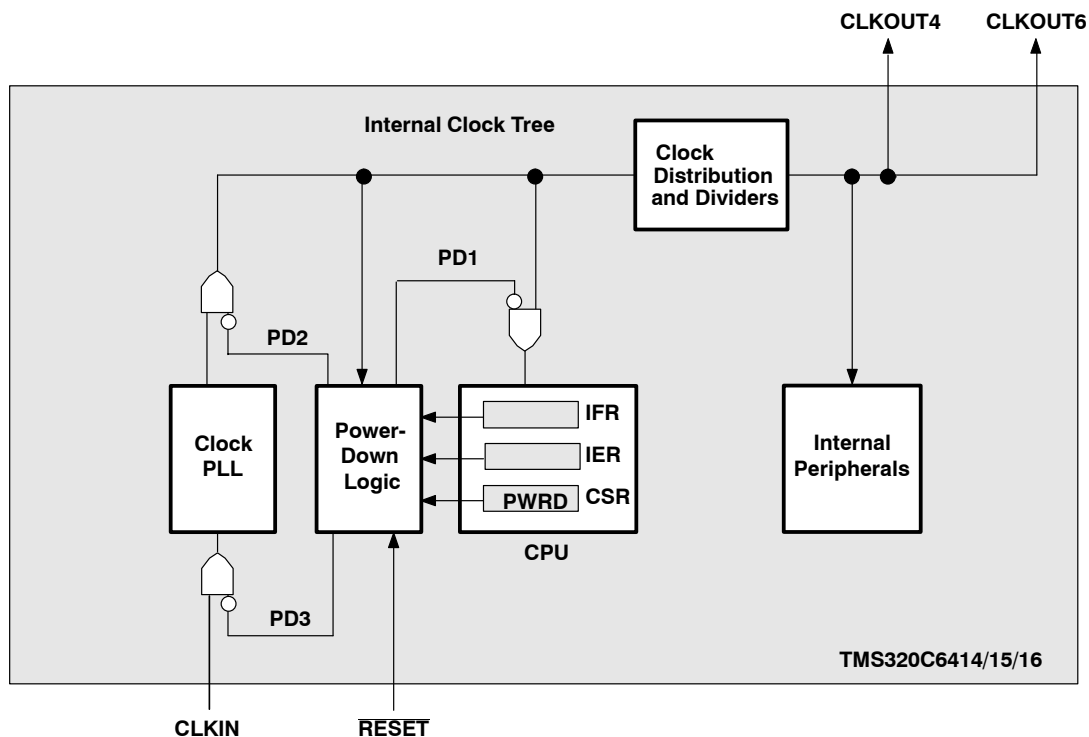

For more detailed information on general-purpose inputs/outputs (GPIOs), see the *TMS320C6000 DSP General-Purpose Input/Output (GPIO) Reference Guide* (literature number SPRU584).

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

power-down mode logic

Figure 9 shows the power-down mode logic on the C6414/C6415/C6416.

† External input clocks, with the exception of CLKIN, are *not* gated by the power-down mode logic.

Figure 9. Power-Down Mode Logic†

triggering, wake-up, and effects

The power-down modes and their wake-up methods are programmed by setting the PWRD field (bits 15–10) of the control status register (CSR). The PWRD field of the CSR is shown in Figure 10 and described in Table 32. When writing to the CSR, all bits of the PWRD field should be set at the same time. Logic 0 should be used when writing to the reserved bit (bit 15) of the PWRD field. The CSR is discussed in detail in the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Legend: R/W-x = Read/write reset value

NOTE: The shadowed bits are not part of the power-down logic discussion and therefore are not covered here. For information on these other bit fields in the CSR register, see the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Figure 10. PWRD Field of the CSR Register

A delay of up to nine cycles may occur after the instruction that sets the PWRD bits in the CSR before the PD mode takes effect. As best practice, NOPs should be padded after the PWRD bits are set in the CSR to account for this delay.

If PD1 mode is terminated by a non-enabled interrupt, the program execution returns to the instruction where PD1 took effect. If PD1 mode is terminated by an enabled interrupt, the interrupt service routine will be executed first, then the program execution returns to the instruction where PD1 took effect. In the case with an enabled interrupt, the GIE bit in the CSR and the NMIE bit in the interrupt enable register (IER) must also be set in order for the interrupt service routine to execute; otherwise, execution returns to the instruction where PD1 took effect upon PD1 mode termination by an enabled interrupt.

PD2 and PD3 modes can only be aborted by device reset. Table 32 summarizes all the power-down modes.

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

Table 32. Characteristics of the Power-Down Modes

PRWD FIELD (BITS 15–10)	POWER-DOWN MODE	WAKE-UP METHOD	EFFECT ON CHIP'S OPERATION
000000	No power-down	—	—
001001	PD1	Wake by an enabled interrupt	CPU halted (except for the interrupt logic) Power-down mode blocks the internal clock inputs at the boundary of the CPU, preventing most of the CPU's logic from switching. During PD1, EDMA transactions can proceed between peripherals and internal memory.
010001	PD1	Wake by an enabled or non-enabled interrupt	
011010	PD2 [†]	Wake by a device reset	Output clock from PLL is halted, stopping the internal clock structure from switching and resulting in the entire chip being halted. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off.
011100	PD3 [†]	Wake by a device reset	Input clock to the PLL stops generating clocks. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off. Following reset, the PLL needs time to re-lock, just as it does following power-up. Wake-up from PD3 takes longer than wake-up from PD2 because the PLL needs to be re-locked, just as it does following power-up.
All others	Reserved	—	—

[†] When entering PD2 and PD3, all functional I/O remains in the previous state. However, for peripherals which are asynchronous in nature or peripherals with an external clock source, output signals may transition in response to stimulus on the inputs. Under these conditions, peripherals will not operate according to specifications.

C64x power-down mode with an emulator

If user power-down modes are programmed, and an emulator is attached, the modes will be masked to allow the emulator access to the system. This condition prevails until the emulator is reset or the cable is removed from the header. If power measurements are to be performed when in a power-down mode, the emulator cable should be removed.

When the DSP is in power-down mode PD2 or PD3, emulation logic will force any emulation execution command (such as Step or Run) to spin in IDLE. For this reason, PC writes (such as loading code) will fail. A DSP reset will be required to get the DSP out of PD2/PD3.

power-supply sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time (>1 second) if the other supply is below the proper operating voltage.

power-supply design considerations

A dual-power supply with simultaneous sequencing can be used to eliminate the delay between core and I/O power up. A Schottky diode can also be used to tie the core rail to the I/O rail (see Figure 11).

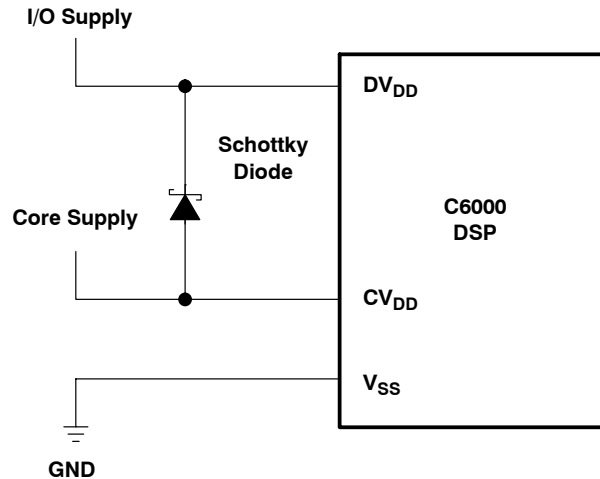

Figure 11. Schottky Diode Diagram

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000™ platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

power-supply decoupling

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. Assuming 0603 caps, the user should be able to fit a total of 60 caps, 30 for the core supply and 30 for the I/O supply. These caps need to be close to the DSP power pins, no more than 1.25 cm maximum distance to be effective. Physically smaller caps, such as 0402, are better because of their lower parasitic inductance. Proper capacitance values are also important. Small bypass caps (near 560 pF) should be closest to the power pins. Medium bypass caps (220 nF or as large as can be obtained in a small package) should be next closest. TI recommends no less than 8 small and 8 medium caps per supply (32 total) be placed immediately next to the BGA vias, using the “interior” BGA space and at least the corners of the “exterior”.

Eight larger caps (4 for each supply) can be placed further away for bulk decoupling. Large bulk caps (on the order of 100 μ F) should be furthest away (but still as close as possible). No less than 4 large caps per supply (8 total) should be placed outside of the BGA.

Any cap selection needs to be evaluated from a yield/manufacturing point-of-view. As with the selection of any component, verification of capacitor availability over the product’s production lifetime should be considered.

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

IEEE 1149.1 JTAG compatibility statement

The TMS320C6414/15/16 DSP requires that both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ be asserted upon power up to be properly initialized. While $\overline{\text{RESET}}$ initializes the DSP core, $\overline{\text{TRST}}$ initializes the DSP's emulation logic. Both resets are required for proper operation.

Note: $\overline{\text{TRST}}$ is synchronous and **must** be clocked by TCLK; otherwise, BSCAN may not respond as expected after $\overline{\text{TRST}}$ is asserted.

While both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ need to be asserted upon power up, only $\overline{\text{RESET}}$ needs to be released for the DSP to boot properly. $\overline{\text{TRST}}$ may be asserted indefinitely for normal operation, keeping the JTAG port interface and DSP's emulation logic in the reset state. $\overline{\text{TRST}}$ only needs to be released when it is necessary to use a JTAG controller to debug the DSP or exercise the DSP's boundary scan functionality. $\overline{\text{RESET}}$ must be released in order for boundary-scan JTAG to read the variant field of IDCODE correctly. Other boundary-scan instructions work correctly independent of current state of $\overline{\text{RESET}}$.

For maximum reliability, the TMS320C6414/15/16 DSP includes an internal pulldown (IPD) on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the DSP's internal emulation logic will always be properly initialized. JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of a pullup resistor on $\overline{\text{TRST}}$. When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the DSP after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations.

Following the release of $\overline{\text{RESET}}$, the low-to-high transition of $\overline{\text{TRST}}$ must occur to latch the state of EMU1 and EMU0. The EMU[1:0] pins configure the device for either Boundary Scan mode or Normal/Emulation mode. For more detailed information, see the terminal functions section of this data sheet.

Note: The DESIGN_WARNING section of the TMS320C6414/15/16 BSDL file contains information and constraints regarding proper device operation while in Boundary Scan Mode.

EMIF device speed

The rated EMIF speed, referring to both EMIFA and EMIFB, of these devices only applies to the SDRAM interface when in a system that meets the following requirements:

- 1 chip-enable (CE) space (maximum of 2 chips) of SDRAM connected to EMIF
- up to 1 CE space of buffers connected to EMIF
- EMIF trace lengths between 1 and 3 inches
- 166-MHz SDRAM for 133-MHz operation (applies only to EMIFA)
- 143-MHz SDRAM for 100-MHz operation

Other configurations may be possible, but timing analysis must be done to verify all AC timings are met. Verification of AC timings is mandatory when using configurations other than those specified above. TI recommends utilizing I/O buffer information specification (IBIS) to analyze all AC timings.

To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839).

To maintain signal integrity, serial termination resistors should be inserted into all EMIF output signal lines (see the Terminal Functions table for the EMIF output signals).

bootmode

The C6414/15/16 device resets using the active-low signal $\overline{\text{RESET}}$. While $\overline{\text{RESET}}$ is low, the device is held in reset and is initialized to the prescribed reset state. Refer to reset timing for reset timing characteristics and states of device pins during reset. The release of $\overline{\text{RESET}}$ starts the processor running with the prescribed device configuration and boot mode.

The C6414/C6415/C6416 has three types of boot modes:

- Host boot

If host boot is selected, upon release of $\overline{\text{RESET}}$, the CPU is internally “stalled” while the remainder of the device is released. During this period, an external host can initialize the CPU’s memory space as necessary through the host interface, including internal configuration registers, such as those that control the EMIF or other peripherals. For the C6414 device, the HPI peripheral is used for host boot. For the C6415/C6416 device, the HPI peripheral is used for host boot if $\text{PCI_EN} = 0$, and the PCI peripheral is used for host boot if $\text{PCI_EN} = 1$. Once the host is finished with all necessary initialization, it must set the DSPINT bit in the HPIC register to complete the boot process. This transition causes the boot configuration logic to bring the CPU out of the “stalled” state. The CPU then begins execution from address 0. The DSPINT condition is not latched by the CPU, because it occurs while the CPU is still internally “stalled”. Also, DSPINT brings the CPU out of the “stalled” state only if the host boot process is selected. All memory may be written to and read by the host. This allows for the host to verify what it sends to the DSP if required. After the CPU is out of the “stalled” state, the CPU needs to clear the DSPINT, otherwise, no more DSPINTs can be received.

- EMIF boot (using default ROM timings)

Upon the release of $\overline{\text{RESET}}$, the 1K-Byte ROM code located in the beginning of $\overline{\text{CE1}}$ is copied to address 0 by the EDMA using the default ROM timings, while the CPU is internally “stalled”. The data should be stored in the endian format that the system is using. In this case, the EMIF automatically assembles consecutive 8-bit bytes to form the 32-bit instruction words to be copied. The transfer is automatically done by the EDMA as a single-frame block transfer from the ROM to address 0. After completion of the block transfer, the CPU is released from the “stalled” state and starts running from address 0.

- No boot

With no boot, the CPU begins direct execution from the memory located at address 0. Note: operation is undefined if invalid code is located at address 0.

reset

A hardware reset ($\overline{\text{RESET}}$) is required to place the DSP into a known good state out of power-up. The $\overline{\text{RESET}}$ signal can be asserted (pulled low) prior to ramping the core and I/O voltages or after the core and I/O voltages have reached their proper operating conditions. As a best practice, reset should be held low during power-up. Prior to deasserting $\overline{\text{RESET}}$ (low-to-high transition), the core and I/O voltages should be at their proper operating conditions and CLKIN should also be running at the correct frequency.

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

absolute maximum ratings over operating case temperature range (unless otherwise noted)[†]

Supply voltage ranges:	CV _{DD} (see Note 1)	– 0.3 V to 1.8 V
	DV _{DD} (see Note 1)	–0.3 V to 4 V
Input voltage ranges:	(except PCI), V _I	–0.3 V to 4 V
	(PCI), V _{IP} [C6415 and C6416 only]	–0.5 V to DV _{DD} + 0.5 V
Output voltage ranges:	(except PCI), V _O	–0.3 V to 4 V
	(PCI), V _{OP} [C6415 and C6416 only]	–0.5 V to DV _{DD} + 0.5 V
Operating case temperature ranges, T _C :	(default)	0°C to 90°C
	(A version) [A-5E0, A-6E3]	–40°C to 105°C
Storage temperature range, T _{stg}		–65°C to 150°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to V_{SS}.

recommended operating conditions

		MIN	NOM	MAX	UNIT
CV _{DD}	Supply voltage, Core (-5E0 device) [‡]	1.14	1.2	1.26	V
CV _{DD}	Supply voltage, Core (A-5E0 device) [‡]	1.19	1.25	1.31	V
CV _{DD}	Supply voltage, Core (-6E3, A-6E3, -7E3 devices) [‡]	1.36	1.4	1.44	V
DV _{DD}	Supply voltage, I/O	3.14	3.3	3.46	V
V _{SS}	Supply ground	0	0	0	V
V _{IH}	High-level input voltage (except PCI)	2			V
V _{IL}	Low-level input voltage (except PCI)			0.8	V
V _{IP}	Input voltage (PCI) [C6415 and C6416 only]	–0.5		DV _{DD} + 0.5	V
V _{IHP}	High-level input voltage (PCI) [C6415 and C6416 only]	0.5DV _{DD}		DV _{DD} + 0.5	V
V _{ILP}	Low-level input voltage (PCI) [C6415 and C6416 only]	–0.5		0.3DV _{DD}	V
V _{OS}	Maximum voltage during overshoot/undershoot	–1.0 [§]		4.3 [§]	V
T _C	Operating case temperature	Default		90	°C
		A version (C6414/15/16GLZA-5E0 and GLZA-6E3 only)	–40	105	°C

[‡] Future variants of the C641x DSPs may operate at voltages ranging from 0.9 V to 1.4 V to provide a range of system power/performance options. TI highly recommends that users design-in a supply that can handle multiple voltages within this range (i.e., 1.2 V, 1.25 V, 1.3 V, 1.35 V, 1.4 V with ± 3% tolerances) by implementing simple board changes such as reference resistor values or input pin configuration modifications. Examples of such supplies include the PT4660, PT5500, PT5520, PT6440, and PT6930 series from Power Trends, a subsidiary of Texas Instruments. Not incorporating a flexible supply may limit the system’s ability to easily adapt to future versions of C641x devices.

[§] The absolute maximum ratings should *not* be exceeded for more than 30% of the cycle period.

C _i	Input capacitance					10	pF
C _o	Output capacitance					10	pF

† For test conditions shown as MIN, MAX, or NOM, use the appropriate value specified in the recommended operating conditions table.

‡ Applies only to pins with an internal pullup (IPU) or pulldown (IPD) resistor.

§ PCI input leakage currents include Hi-Z output leakage for all bidirectional buffers with 3-state outputs.

¶ These rated numbers are from the PCI specification version 2.3. The DC specification and AC specification are defined in Tables 4-3 and 4-4, respectively.

Measured with average activity (50% high/50% low power). The actual current draw is highly application-dependent. For more details on core and I/O activity, refer to the *TMS320C6414/15/16 Power Consumption Summary* application report (literature number SPRA811).

recommended clock and control signal transition behavior

All clocks and control signals **must** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

PARAMETER MEASUREMENT INFORMATION

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 12. Test Load Circuit for AC Timing Measurements

The tester load circuit is for characterization and measurement of AC timing signals. This load does not indicate the maximum load the device is capable of driving.

signal transition levels

All input and output timing parameters are referenced to 1.5 V for both “0” and “1” logic levels.

Figure 13. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to $V_{IL\ MAX}$ and $V_{IH\ MIN}$ for input clocks, $V_{OL\ MAX}$ and $V_{OH\ MIN}$ for output clocks, $V_{ILP\ MAX}$ and $V_{IHP\ MIN}$ for PCI input clocks, and $V_{OLP\ MAX}$ and $V_{OHP\ MIN}$ for PCI output clocks.

Figure 14. Rise and Fall Transition Time Voltage Reference Levels

signal transition rates

All timings are tested with an input edge rate of 4 Volts per nanosecond (4 V/ns).

PARAMETER MEASUREMENT INFORMATION (CONTINUED)

timing parameters and board routing analysis

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. If needed, external logic hardware such as buffers may be used to compensate any timing differences.

For inputs, timing is most impacted by the round-trip propagation delay from the DSP to the external device and from the external device to the DSP. This round-trip delay tends to negatively impact the input setup time margin, but also tends to improve the input hold time margins (see Table 33 and Figure 15).

Figure 15 represents a general transfer between the DSP and an external device. The figure also represents board route delays and how they are perceived by the DSP and the external device.

Table 33. Board-Level Timings Example (see Figure 15)

NO.	DESCRIPTION
1	Clock route delay
2	Minimum DSP hold time
3	Minimum DSP setup time
4	External device hold time requirement
5	External device setup time requirement
6	Control signal route delay
7	External device hold time
8	External device access time
9	DSP hold time requirement
10	DSP setup time requirement
11	Data route delay

† Control signals include data for Writes.

‡ Data signals are generated during Reads from an external device.

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

INPUT AND OUTPUT CLOCKS (CONTINUED)

timing requirements for ECLKIN for EMIFA and EMIFB^{†‡§¶} (see Figure 19)

NO.			-5E0, A-5E0, -6E3, A-6E3, -7E3		UNIT
			MIN	MAX	
1	$t_{c(EKI)}$	Cycle time, ECLKIN	6 [#]	16P	ns
2	$t_{w(EKI H)}$	Pulse duration, ECLKIN high	2.7		ns
3	$t_{w(EKI L)}$	Pulse duration, ECLKIN low	2.7		ns
4	$t_{t(EKI)}$	Transition time, ECLKIN		2	ns
5	$t_{j(EKI)}$	Period jitter, ECLKIN	0.02E		ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 600 MHz, use P = 1.67 ns.

[‡] The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.

[§] These C64x™ devices have two EMIFs (64-bit EMIFA and 16-bit EMIFB). All EMIFA signals are prefixed by an "A" and all EMIFB signals are prefixed by a "B". Throughout the rest of this document, in generic EMIF areas of discussion, the prefix "A" or "B" may be omitted.

[¶] E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns for EMIFA or EMIFB.

[#] Minimum ECLKIN cycle times *must* be met, even when ECLKIN is generated by an internal clock source. Minimum ECLKIN times are based on internal logic speed; the maximum useable speed of the EMIF may be lower due to AC timing requirements. On the 7E3 and 6E3 devices, 133-MHz operation is achievable if the requirements of the EMIF Device Speed section are met. On the 5E0 devices, 100-MHz operation is achievable if the requirements of the EMIF Device Speed section are met.

Figure 19. ECLKIN Timing for EMIFA and EMIFB

switching characteristics over recommended operating conditions for ECLKOUT1 for EMIFA and EMIFB modules^{§¶||*} (see Figure 20)

Figure 22. Asynchronous Memory Read Timing for EMIFA and EMIFB†

ASYNCHRONOUS MEMORY TIMING (CONTINUED)

[†] These C64x™ devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an “A” and all EMIFB signals are prefixed by a “B”. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix “A” or “B” may be omitted [e.g., the asynchronous memory access signals are shown as generic (AOE, ARE, and AWE) instead of AAOE, AARE, and AAWE (for EMIFA) and BAOE, BARE, and BAWE (for EMIFB)].

[‡] AOE/SDRAS/SOE, ARE/SDCAS/SADS/SRE, and AWE/SDWE/SWE operate as AOE (identified under select signals), ARE, and AWE, respectively, during asynchronous memory accesses.

HOLD/HOLDA TIMING

timing requirements for the $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ cycles for EMIFA and EMIFB modules[†] (see Figure 35)

NO.		-5E0 A-5E0		-6E3 A-6E3 -7E3		UNIT
		MIN	MAX	MIN	MAX	
3	$t_{h(\text{HOLDAL-HOLDL})}$ Hold time, $\overline{\text{HOLD}}$ low after $\overline{\text{HOLDA}}$ low	E		E		ns

[†] E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns for EMIFA or EMIFB.

switching characteristics over recommended operating conditions for the $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ cycles for EMIFA and EMIFB modules^{†‡§} (see Figure 35)

NO.	PARAMETER	-5E0 A-5E0		-6E3 A-6E3 -7E3		UNIT
		MIN	MAX	MIN	MAX	
1	$t_{d(\text{HOLDL-EMHZ})}$ Delay time, $\overline{\text{HOLD}}$ low to EMIF Bus high impedance	2E	†	2E	†	ns
2	$t_{d(\text{EMHZ-HOLDAL})}$ Delay time, EMIF Bus high impedance to $\overline{\text{HOLDA}}$ low	0	2E	0	2E	ns
4	$t_{d(\text{HOLDH-EMLZ})}$ Delay time, $\overline{\text{HOLD}}$ high to EMIF Bus low impedance	2E	7E	2E	7E	ns
5	$t_{d(\text{EMLZ-HOLDAH})}$ Delay time, EMIF Bus low impedance to $\overline{\text{HOLDA}}$ high	0	2E	0	2E	ns
6	$t_{d(\text{HOLDL-EKOHZ})}$ Delay time, $\overline{\text{HOLD}}$ low to ECLKOUTx high impedance	2E	†	2E	†	ns
7	$t_{d(\text{HOLDH-EKOLZ})}$ Delay time, $\overline{\text{HOLD}}$ high to ECLKOUTx low impedance	2E	7E	2E <td 7E	ns	

[†] E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns for EMIFA or EMIFB.

[‡] For EMIFA, EMIF Bus consists of: $\overline{\text{ACE}}[3:0]$, $\overline{\text{ABE}}[7:0]$, $\overline{\text{AED}}[63:0]$, $\overline{\text{AEA}}[22:3]$, $\overline{\text{AARE}}/\overline{\text{ASDCAS}}/\overline{\text{ASADS}}/\overline{\text{ASRE}}$, $\overline{\text{AAOE}}/\overline{\text{ASDRAS}}/\overline{\text{ASOE}}$, and $\overline{\text{AAWE}}/\overline{\text{ASDWE}}/\overline{\text{ASWE}}$, $\overline{\text{ASDCKE}}$, $\overline{\text{ASOE3}}$, and $\overline{\text{APDT}}$.

For EMIFB, EMIF Bus consists of: $\overline{\text{BCE}}[3:0]$, $\overline{\text{BBE}}[1:0]$, $\overline{\text{BED}}[15:0]$, $\overline{\text{BEA}}[20:1]$, $\overline{\text{BARE}}/\overline{\text{BSDCAS}}/\overline{\text{BSADS}}/\overline{\text{BSRE}}$, $\overline{\text{BAOE}}/\overline{\text{BSDRAS}}/\overline{\text{BSOE}}$, and $\overline{\text{BAWE}}/\overline{\text{BSDWE}}/\overline{\text{BSWE}}$, $\overline{\text{BSOE3}}$, and $\overline{\text{BPDT}}$.

[§] The EKxHZ bits in the EMIF Global Control register (GBLCTL) determine the state of the ECLKOUTx signals during $\overline{\text{HOLDA}}$. If EKxHZ = 0, ECLKOUTx continues clocking during Hold mode. If EKxHZ = 1, ECLKOUTx goes to high impedance during Hold mode, as shown in Figure 35.

^{††} All pending EMIF transactions are allowed to complete before $\overline{\text{HOLDA}}$ is asserted. If no bus transactions are occurring, then the minimum delay time can be achieved. Also, bus hold can be indefinitely delayed by setting NOHOLD = 1.

[†] For EMIFA, EMIF Bus consists of: $\overline{\text{ACE}}[3:0]$, $\overline{\text{ABE}}[7:0]$, $\overline{\text{AED}}[63:0]$, $\overline{\text{AEA}}[22:3]$, $\overline{\text{AARE}}/\overline{\text{ASDCAS}}/\overline{\text{ASADS}}/\overline{\text{ASRE}}$, $\overline{\text{AAOE}}/\overline{\text{ASDRAS}}/\overline{\text{ASOE}}$, and $\overline{\text{AAWE}}/\overline{\text{ASDWE}}/\overline{\text{ASWE}}$, $\overline{\text{ASDCKE}}$, $\overline{\text{ASOE3}}$, and $\overline{\text{APDT}}$.

For EMIFB, EMIF Bus consists of: $\overline{\text{BCE}}[3:0]$, $\overline{\text{BBE}}[1:0]$, $\overline{\text{BED}}[15:0]$, $\overline{\text{BEA}}[20:1]$, $\overline{\text{BARE}}/\overline{\text{BSDCAS}}/\overline{\text{BSADS}}/\overline{\text{BSRE}}$, $\overline{\text{BAOE}}/\overline{\text{BSDRAS}}/\overline{\text{BSOE}}$, and $\overline{\text{BAWE}}/\overline{\text{BSDWE}}/\overline{\text{BSWE}}$, $\overline{\text{BSOE3}}$, and $\overline{\text{BPDT}}$.

[‡] The EKxHZ bits in the EMIF Global Control register (GBLCTL) determine the state of the ECLKOUTx signals during $\overline{\text{HOLDA}}$. If EKxHZ = 0, ECLKOUTx continues clocking during Hold mode. If EKxHZ = 1, ECLKOUTx goes to high impedance during Hold mode, as shown in Figure 35.

Figure 35. $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ Timing for EMIFA and EMIFB

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

BUSREQ TIMING

switching characteristics over recommended operating conditions for the BUSREQ cycles for EMIFA and EMIFB modules (see Figure 36)

NO.	PARAMETER	-5E0 A-5E0		-6E3 A-6E3 -7E3		UNIT
		MIN	MAX	MIN	MAX	
1	$t_{d(AEKO1H-ABUSRV)}$ Delay time, AECLKOUTx high to ABUSREQ valid	0.6	7.1	1	5.5	ns
2	$t_{d(BEKO1H-BBUSRV)}$ Delay time, BECLKOUTx high to BBUSREQ valid	0.5	6.9	0.9	5.5	ns

Figure 36. BUSREQ Timing for EMIFA and EMIFB

RESET TIMING

timing requirements for reset[†] (see Figure 37)

NO.			-5E0, A-5E0, -6E3, A-6E3, -7E3		UNIT
			MIN	MAX	
1	$t_{w(RST)}$	Width of the RESET pulse (PLL stable) [‡]	10P		ns
		Width of the RESET pulse (PLL needs to sync up) [§]	250		μs
16	$t_{su(boot)}$	Setup time, boot configuration bits valid before RESET high [¶]	4E or 4C [#]		ns
17	$t_{h(boot)}$	Hold time, boot configuration bits valid after RESET high [¶]	4P		ns
18	$t_{su(PCLK-RSTH)}$	Setup time, PCLK active before RESET high	32N		ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 600 MHz, use P = 1.67 ns.

[‡] This parameter applies to CLKMODE x1 when CLKIN is stable, and applies to CLKMODE x6, x12 when CLKIN and PLL are stable.

[§] This parameter applies to CLKMODE x6, x12 only (it does not apply to CLKMODE x1). The RESET signal is not connected internally to the clock PLL circuit. The PLL, however, may need up to 250 μs to stabilize following device power up or after PLL configuration has been changed. During that time, RESET must be asserted to ensure proper device operation. See the *clock PLL* section for PLL lock times.

[¶] EMIFB address pins BEA[20:13, 11, 7] are the boot configuration pins during device reset.

[#] E = 1/AECLKIN clock frequency in ns. C = 1/CLKIN clock frequency in ns. Select whichever value is larger for the MIN parameter.

^{||} N = the PCI input clock (PCLK) period in ns. When PCI is enabled (PCI_EN = 1), this parameter *must* be met.

switching characteristics over recommended operating conditions during reset^{†*□} (see Figure 37)

13	$t_{d(RSTH-LOWV)}$	Delay time, RESET high to low group valid	11P		ns
14	$t_{d(RSTL-ZHZ)}$	Delay time, RESET low to Z group high impedance	0		ns
15	$t_{d(RSTH-ZV)}$	Delay time, RESET high to Z group valid	2P	8P	ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 600 MHz, use P = 1.67 ns.

^{*} E = the EMIF input clock (ECLKIN, CPU/4 clock, or CPU/6 clock) period in ns for EMIFA or EMIFB.

[□] EMIF Z group consists of: AEA[22:3], BEA[20:1], AED[63:0], BED[15:0], CE[3:0], ABE[7:0], BBE[1:0], ARE/SDCAS/SADS/SRE, AWE/SDWE/SWE, and AOE/SDRAS/SOE, SOE3, ASDCKE, and PDT.

EMIF high group consists of: AHOLDA and BHOLDA (when the corresponding HOLD input is high)

EMIF low group consists of: ABUSREQ and BBUSREQ; AHOLDA and BHOLDA (when the corresponding HOLD input is low)

Low group consists of: XSP_CS, CLKX2/XSP_CLK, and DX2/XSP_DO; all of which apply only when PCI EEPROM (BEA13) is enabled (with PCI_EN = 1 and MCBSP2_EN = 0). Otherwise, the CLKX2/XSP_CLK and DX2/XSP_DO pins are in the Z group. For more details on the PCI configuration pins, see the Device Configurations section of this data sheet.

Z group consists of: HD[31:0]/AD[31:0], CLKX0, CLKX1/URADDR4, CLKX2/XSP_CLK, FSX0, FSX1/UXADDR3, FSX2, DX0, DX1/UXADDR4, DX2/XSP_DO, CLKR0, CLKR1/URADDR2, CLKR2, FSR0, FSR1/UXADDR2, FSR2, TOUT0, TOUT1, TOUT2, GP[8:0], GP10/PCBE3, HR/W/PCBE2, HDS2/PCBE1, PCBE0, GP13/PINTA, GP11/PREQ, HDS1/PSERR, HCS/PPERR, HCNTL1/PDEVSEL, HAS/PPAR, HCNTL0/PSTOP, HHWIL/PTRDY (16-bit HPI mode only), HRDY/PIRDY, HINT/PFRAME, UXDATA[7:0], UXSOC, UXCLAV, and URCLAV.

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146N – FEBRUARY 2001 – REVISED MAY 2005

† These C64x™ devices have two EMIFs (EMIFA and EMIFB). All EMIFA signals are prefixed by an “A” and all EMIFB signals are prefixed by a “B”. Throughout the rest of this document, in generic EMIF areas of discussion, the prefix “A” or “B” may be omitted [e.g., ECLKIN, ECLKOUT1, and ECLKOUT2].

‡ EMIF Z group consists of: AEA[22:3], BEA[20:1], AED[63:0], BED[15:0], \overline{CE} [3:0], \overline{ABE} [7:0], \overline{BBE} [1:0], $\overline{ARE}/\overline{SDCAS}/\overline{SADS}/\overline{SRE}$, $\overline{AW}/\overline{SDWE}/\overline{SWE}$, and $\overline{AOE}/\overline{SDRAS}/\overline{SOE}$, SOE3, ASDCKE, and PDT.

EMIF high group consists of: \overline{AHOLDA} and \overline{BHOLDA} (when the corresponding \overline{HOLD} input is high)

EMIF low group consists of: $\overline{ABUSREQ}$ and $\overline{BBUSREQ}$; \overline{AHOLDA} and \overline{BHOLDA} (when the corresponding \overline{HOLD} input is low)

Low group consists of: XSP_CS, CLKX2/XSP_CLK, and DX2/XSP_DO; all of which apply only when PCI EEPROM (BEA13) is enabled (with $\overline{PCI_EN} = 1$ and $\overline{MCBSP2_EN} = 0$). Otherwise, the CLKX2/XSP_CLK and DX2/XSP_DO pins are in the Z group. For more details on the PCI configuration pins, see the Device Configurations section of this data sheet.

Z group consists of: HD[31:0]/AD[31:0], CLKX0, CLKX1/URADDR4, CLKX2/XSP_CLK, FSX0, FSX1/UXADDR3, FSX2, DX0, DX1/UXADDR4, DX2/XSP_DO, CLKR0, CLKR1/URADDR2, CLKR2, FSR0, FSR1/UXADDR2, FSR2, TOUT0, TOUT1, TOUT2, GP[8:0], GP10/PCBE3, HR/W/PCBE2, HDS2/PCBE1, PCBE0, GP13/PINTA, GP11/PREQ, HDS1/PSERR, HCS/PPERR, HCNTL1/PDEVSEL, HAS/PPAR, HCNTL0/PSTOP, HHWL/PTRDY (16-bit HPI mode only), HRDY/PIRDY, HINT/PFRAME, UXDATA[7:0], UXSOC, UXCLAV, and URCLAV.

§ If BEA[20:13, 11, 7] and HD5/AD5 pins are actively driven, care must be taken to ensure no timing contention between parameters 6, 7, 14, 15, 16, and 17.

¶ Boot and Device Configurations Inputs (during reset) include: EMIFB address pins BEA[20:13, 11, 7] and HD5/AD5.

The $\overline{PCI_EN}$ pin *must* be driven valid at all times and the user *must not* switch values throughout device operation.

The $\overline{MCBSP2_EN}$ pin *must* be driven valid at all times and the user *can* switch values throughout device operation.

Figure 37. Reset Timing†

EXTERNAL INTERRUPT TIMING

timing requirements for external interrupts[†] (see Figure 38)

NO.			-5E0, A-5E0, -6E3, A-6E3, -7E3		UNIT
			MIN	MAX	
1	$t_{w(ILOW)}$	Width of the NMI interrupt pulse low	4P		ns
		Width of the EXT_INT interrupt pulse low	8P		ns
2	$t_{w(IHIGH)}$	Width of the NMI interrupt pulse high	4P		ns
		Width of the EXT_INT interrupt pulse high	8P		ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 600 MHz, use P = 1.67 ns.

Figure 38. External/NMI Interrupt Timing

TMS320C6414, TMS320C6415, TMS320C6416 FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS146L – FEBRUARY 2001 – REVISED JULY 2004

HOST-PORT INTERFACE (HPI) TIMING

timing requirements for host-port interface cycles^{†‡} (see Figure 39 through Figure 46)

NO.			-5E0, A-5E0, -6E3, A-6E3, -7E3		UNIT
			MIN	MAX	
1	$t_{su}(SELV-HSTBL)$	Setup time, select signals [§] valid before $\overline{HSTROBE}$ low	5		ns
2	$t_h(HSTBL-SELV)$	Hold time, select signals [§] valid after $\overline{HSTROBE}$ low	2.4		ns
3	$t_w(HSTBL)$	Pulse duration, $\overline{HSTROBE}$ low	4P [¶]		ns
4	$t_w(HSTBH)$	Pulse duration, $\overline{HSTROBE}$ high between consecutive accesses	4P		ns
10	$t_{su}(SELV-HASL)$	Setup time, select signals [§] valid before \overline{HAS} low	5		ns
11	$t_h(HASL-SELV)$	Hold time, select signals [§] valid after \overline{HAS} low	2		ns
12	$t_{su}(HDV-HSTBH)$	Setup time, host data valid before $\overline{HSTROBE}$ high	5		ns
13	$t_h(HSTBH-HDV)$	Hold time, host data valid after $\overline{HSTROBE}$ high	2.8		ns
14	$t_h(HRDYL-HSTBL)$	Hold time, $\overline{HSTROBE}$ low after \overline{HRDY} low. $\overline{HSTROBE}$ should not be inactivated until \overline{HRDY} is active (low); otherwise, HPI writes will not complete properly.	2		ns
18	$t_{su}(HASL-HSTBL)$	Setup time, \overline{HAS} low before $\overline{HSTROBE}$ low	2		ns
19	$t_h(HSTBL-HASL)$	Hold time, \overline{HAS} low after $\overline{HSTROBE}$ low	2.1		ns

[†] $\overline{HSTROBE}$ refers to the following logical operation on HCS, HDS1, and HDS2: [NOT(HDS1 XOR HDS2)] OR HCS.

[‡] P = 1/CPU clock frequency in ns. For example, when running parts at 600 MHz, use P = 1.67 ns.

[§] Select signals include: HCNTL[1:0] and HR/W. For HPI16 mode only, select signals also include HHWIL.

[¶] Select the parameter value of 4P or 12.5 ns, whichever is greater.

switching characteristics over recommended operating conditions during host-port interface cycles^{†‡} (see Figure 39 through Figure 46)

NO.	PARAMETER	-5E0 -6E3 -7E3		A-5E0 A-6E3		UNIT
		MIN	MAX	MIN	MAX	
6	$t_d(HSTBL-HRDYH)$ Delay time, $\overline{HSTROBE}$ low to \overline{HRDY} high [#]	1.3	4P + 8	1.3	4P + 9	ns
7	$t_d(HSTBL-HDLZ)$ Delay time, $\overline{HSTROBE}$ low to HD low impedance for an HPI read	2		2		ns
8	$t_d(HDV-HRDYL)$ Delay time, HD valid to \overline{HRDY} low	-3		-3		ns
9	$t_{oh}(HSTBH-HDV)$ Output hold time, HD valid after $\overline{HSTROBE}$ high	1.5		1.5		ns
15	$t_d(HSTBH-HDHZ)$ Delay time, $\overline{HSTROBE}$ high to HD high impedance		12		12	ns
16	$t_d(HSTBL-HDV)$ Delay time, $\overline{HSTROBE}$ low to HD valid (HPI16 mode, 2nd half-word only)		4P + 8		4P + 8	ns

[†] $\overline{HSTROBE}$ refers to the following logical operation on HCS, HDS1, and HDS2: [NOT(HDS1 XOR HDS2)] OR HCS.

[‡] P = 1/CPU clock frequency in ns. For example, when running parts at 600 MHz, use P = 1.67 ns.

[#] This parameter is used during HPID reads and writes. For reads, at the beginning of a word transfer (HPI32) or the first half-word transfer (HPI16) on the falling edge of $\overline{HSTROBE}$, the HPI sends the request to the EDMA internal address generation hardware, and \overline{HRDY} remains high until the EDMA internal address generation hardware loads the requested data into HPID. For writes, \overline{HRDY} goes high if the internal write buffer is full.

HOST-PORT INTERFACE (HPI) TIMING (CONTINUED)

† HSTROBE refers to the following logical operation on HCS, HDST1, and HDS2: $[\text{NOT}(\text{HDST1 XOR HDS2})] \text{ OR HCS}$.

TIMER TIMING

timing requirements for timer inputs[†] (see Figure 61)

NO.		-5E0, A-5E0, -6E3, A-6E3, -7E3		UNIT
		MIN	MAX	
1	$t_w(\text{TINPH})$ Pulse duration, TINP high	8P		ns
2	$t_w(\text{TINPL})$ Pulse duration, TINP low	8P		ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 600 MHz, use P = 1.67 ns.

switching characteristics over recommended operating conditions for timer outputs[†]
(see Figure 61)

NO.	PARAMETER	-5E0, A-5E0, -6E3, A-6E3, -7E3		UNIT
		MIN	MAX	
3	$t_w(\text{TOUTH})$ Pulse duration, TOUT high	8P-3		ns
4	$t_w(\text{TOU TL})$ Pulse duration, TOUT low	8P-3		ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 600 MHz, use P = 1.67 ns.

Figure 61. Timer Timing

GENERAL-PURPOSE INPUT/OUTPUT (GPIO) PORT TIMING

timing requirements for GPIO inputs^{†‡} (see Figure 62)

NO.		-5E0, A-5E0, -6E3, A-6E3, -7E3		UNIT
		MIN	MAX	
1	$t_w(\text{GPIH})$ Pulse duration, GPIx high	8P		ns
2	$t_w(\text{GPIL})$ Pulse duration, GPIx low	8P		ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 600 MHz, use P = 1.67 ns.

[‡] The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have the DSP recognize the GPIx changes through software polling of the GPIO register, the GPIx duration must be extended to at least 12P to allow the DSP enough time to access the GPIO register through the CFGBUS.

switching characteristics over recommended operating conditions for GPIO outputs[†]
(see Figure 62)

NO.	PARAMETER	-5E0, A-5E0, -6E3, A-6E3, -7E3		UNIT
		MIN	MAX	
3	$t_w(\text{GPOH})$ Pulse duration, GPOx high	24P	8 [‡]	ns
4	$t_w(\text{GPOL})$ Pulse duration, GPOx low	24P	8 [‡]	ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 600 MHz, use P = 1.67 ns.

[‡] This parameter value should not be used as a maximum performance specification. Actual performance of back-to-back accesses of the GPIO is dependent upon internal bus activity.

SPRS146L – FEBRUARY 2001 – REVISED JULY 2004

MECHANICAL DATA FOR C6414, C6415, AND C6416

The following table(s) show the thermal resistance characteristics for the PBGA — GLZ, ZLZ and CLZ mechanical packages.

thermal resistance characteristics (S-PBGA package) [GLZ]

NO.		Air Flow (m/s [†])	°C/W	°C/W (with Heat Sink [‡])
1	R θ _{JC} Junction-to-case	N/A	1.55	1.0
2	R θ _{JB} Junction-to-board	N/A	9.1	9.0
3	R θ _{JA} Junction-to-free air	0.00	17.9	13.8
4	R θ _{JA} Junction-to-free air	0.5	15.02	8.95
5	R θ _{JA} Junction-to-free air	1.0	13.4	7.35
6	R θ _{JA} Junction-to-free air	2.00	11.89	6.46
7	Psi _{JT} Junction-to-package top	N/A	0.5	0.5
8	Psi _{JB} Junction-to-board	N/A	7.4	7.4

[†] m/s = meters per second

[‡] These thermal resistance numbers were modeled using a heat sink, part number 374024B00035, manufactured by AAVID Thermalloy. AAVID Thermalloy also manufactures a similar epoxy-mounted heat sink, part number 374024B00000. When operating at 720 MHz, a heat sink should be used to reduce the thermal resistance characteristics of the package. TI recommends a passive, laminar heat sink, similar to the part numbers mentioned above.

thermal resistance characteristics (S-PBGA package) [ZLZ]

NO.		Air Flow (m/s [†])	°C/W	°C/W (with Heat Sink [‡])
1	R θ _{JC} Junction-to-case	N/A	1.55	1.0
2	R θ _{JB} Junction-to-board	N/A	9.1	9.0

⁽¹⁾ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
